

2021 Alfalfa Trial

Sea-90 reduces costly Fertilizer inputs by up to 50%!

Maintain yield and quality; improve net profitability.

In 2021 SeaAgri Solutions completed a third-party trial measuring the efficacy of Sea-90 Ocean Mineral supplementation when growing Alfalfa. The trial was completed near Madison, WI by Agricultural Research of Wisconsin.

Soil tests were conducted to determine recommended fertilizer levels. Control plots were planted with 100% of the recommended fertilizer and no Sea-90 application. Test plots included 50 lbs. per acre of Sea-90 Ocean Minerals (broadcast) and fertilizer, applied at 50% of the Control rate.

Trial data showed a slight elevation in Yield and statistically equal Quality Metrics.

This indicates that up to 50% of Fertilizer inputs can be reduced by supplementing with Sea-90 Ocean Minerals.

Maintain yield and quality and improve your net profit!

<i>2nd Cutting</i>	Yield	Protein	RFV	ADF	TDN
Control	3.8b	23.357a	152.49a	32.647a	63.467a
Test	4.1a	22.313a	151.747a	33.083a	63.127a

With traditional Fertilizer availability limited and prices at historic highs, Sea-90 provides an all-natural way to improve profitability and the productivity of your land. This includes organic matter growth and increased CEC levels.

Sea-90 applications cost as low as \$25 per acre and we offer convenient distribution partners throughout the country.
