

1. Start with your choice of 600-800 grit stone/paper. We use diamond stone.
2. Recognize the 4 sides of the Omega. There is the main side, and the back side.

We have found success sharpening back and forth, just forwards, just backwards, and even in a circular motion. Use the method that allows you to get the perfect angle and is most comfortable for you. This guide is based on 1 stroke = back and forth

3. Screw the broadhead into an arrow shaft and mark the main side with a sharpie. Do a few strokes and check the blade. The goal is to find the correct angle. Keep marking the main side and doing a few strokes until the sharpie is evenly removed along the entire blade.
4. Do the same process for the backside. Make sure that you are hitting the very edge here.
5. Now that you have a feel for the correct angle, it is time to sharpen. Start by doing 5-10 strokes on the backside, then doing 5-10 strokes on the main side. Repeat this until the broadhead can easily shave hair and cut paper.
6. Next, do 1-2 strokes on each side (starting with the back, then the main side). Repeat this 3 times and finish with stropping.

We have found that 600 or 800 grit is enough to get this broadhead hair shaving, hunt ready sharp. If further sharpening is desired, we suggest moving to 1000-1200 grit and then 2000 after that. Repeat steps 5 and 6 for each grit you do
