FEATURES OF SUPERLOK TUBE FITTINGS

Superlok Tube Fittings are produced under strict quality control using the highest quality raw materials. Positive material identification (PMI), rigorous testing and quality assurance procedures are the foundation of the Superlok brand.

Superlok Tube Fittings tighten easily and are leak free under shock, vibration and temperature cycling. Superlok fittings feature exceptional internal surface finish which reduces particle entrapment, potential contamination and improves the flow of liquids and gases.

Superlok Instrumentation Valves and Fittings are specified across many global markets including Automotive, Aerospace, Semiconductor, Shipbuilding and Petrochemical industries.

Structure of Superlok Tube Fittings

Superlok consists of 4 precision parts:

- Body
- Front Ferrule
- Rear Ferrule
- Nut

All parts are manufactured to very strict tolerances under tight quality control measures. The result is a highly reliable product that is suitable for demanding conditions across all industrial markets.

Superlok Installation Instructions

Installation under 1 inch or 25 mm:

Superlok Tube Fittings shall be delivered to the customer in a completely assembled state, ready for immediate use. Disassembling the product before installation is not recommended as doing so can result in contamination which can cause leaks.

Superlok Tube Fittings are installed in three easy steps:

Step 1

Insert the tubing into Superlok Tube Fitting. At this point, make sure that the tubing is in contact with the internal shoulder of fitting and then finger-tighten the nut.

Step 2

Before tightening the Superlok nut, mark the starting point at the 6 o'clock position.

Step 3

While holding the fitting body with a wrench, tighten the nut 1-1/4 turns to the 9 o'clock position for sizes 1/4" to 1". For 1/16", 1/8", and 3/16" tighten the nut three quarters turn to the 3 o'clock position. Ensure fitting is properly made using a superlok Gap Inspection Gauge.

Gaugeability

On initial installation, the Superlok Inspection Gauge assures the installer or inspector that a fitting has been sufficiently tightened.

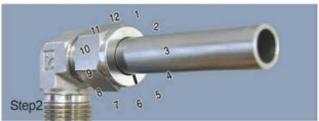

Position the Superlok Inspection Gauge next to the gap between the nut and the body.

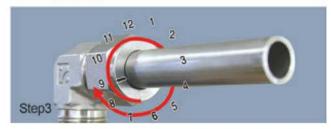

- If the gauge will not enter the gap, the fitting is sufficiently tightened.
- If the gauge will enter the gap, additional tightening is required.

Installation for high pressure or severe service systems:

Since tubing has different O.D. tolerance, it is important to have a common starting point to take out in dimensional variations. This is done by tightening the fitting slightly until the tubing can not freely rotate in the fitting as it can in the finger-tight position. At this point tighten the nut 1-1/4 turns.

Safety Considerations on Installations for High Pressure Systems

- Make sure the proper tubing wall thickness is selected in accordance with pressure ratings. Tubing should have a hardness of HRB 80 or less.
- 2. Do not assemble or disassemble fittings when the system is pressurized.

Re-tightening Instructions:

Step 1

Pic. 1 shows the fitting in the disconnected position. Insert the tubing with the pre-swaged ferrules into the fitting body making sure the front ferrule is firmly seated as shown in Pic 2.

Step 2

Finger tighten the nut and then with a wrench turn the nut to the original 9 o'clock position. At this point a change of resistance will be felt. Tighten the nut slightly more and the installation is complete as shown in Pic 3.

Technical Information

Hardness Limitation

Use only high quality stainless steel tubing that is fully annealed. Seamless tubing or welded per ASTM A269, A213 or equivalent should be used with Superlok Tube

Fittings. The tubing must be a maximum hardness of HRB 90 on the Rockwell Scale, however, HRB 80 is more suitable for bending and results in easier fitting make-up.

Compatibility/Warranty

Superlok Tube Fittings are manufactured to be 100% interchangeable with comparable tube fittings on the market. Superlok fully warrants fittings interchanged with Superlok components per the standard Superlok warranty. Consult Superlok Canada for further details.

Gas System Application

Superlok Tube Fittings are suitable for gas systems. The recommended "best practice" standards below should be followed:

- 1. Tubing hardness must be less than that of the ferrules.
- Tubing should be free of surface imperfections and deformation.
- Refer to table for selection of the appropriate wall thickness (only shaded areas should be selected for gas systems).
- 4. Tubing ends must be cut squarely and perpendicular to the center-line of the tubing. After the tubing is cut, it must be deburred on both the inside and outside with a high quality fully sharpened deburring tool.
- 5. Follow the Superlok installation instructions in the catalog.
- 6. Do not attempt to bend the tubing after a fitting has been installed in a fixed position.
- Tubing systems should be installed to allow for adequate expansion and contraction as well as ease of maintenance.

Material	Bar Stock	Forging
316 SS	ASTM A479 ASTM A276	ASTM A182
Monel, Alloy 400	ASTM B164	ASTM B 564
Inconel, Alloy 600	ASTM B 166	ASTM B 564
Hastelloy, Alloy C-276	ASTM B 574	ASTM B 564
Brass	ASTM B 16 ASTM B 453	ASTM B 283

Superlok Tube Fittings are available standard in stainless steel, brass, and alloy materials. Straight fittings are machined from cold finished bar stock and shaped bodies from forgings. Specifications for fitting materials are listed below. For special applications, contact Superlok Canada.

Maximum Temperature by Materials

Aluminum	400 °F	204 °C
Copper	400 °F	204 ℃
Steel	375 °F	191 °C
SUS304	1000 °F	538 ℃
SUS316	1200 °F	649 ℃
MONEL	800 °F	427 °C

Please refer to ASME B31.3-1993 for detailed information about the maximum and minimum temperature of various materials.

Vacuum, Cryogenic and High Temperature Applications

Superlok Tube Fittings have been tested in vacuum, cryogenic and high temperatures ensuring consistent and reliable performance in the most severe applications.

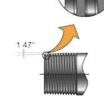

Threads

1. NPT (National Pipe Thread)

- Thread angle 60°
- Tapered angle 1°47'
- Manufactured by the standard of ASME B 1.20.1

2. ISO 7/1 Tapered Thread

- Thread angle 55°
- Tapered angle 1°47'
- Equivalent to the standard of DIN2999, BS21 (BSPT) and JIS B0203 (PT).

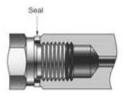

3. ISO 228/1 Parallel Thread

- Thread angle 55°
- Equivalent to the standard of BS 2779 (BSPP), JIS B0202 (PF).
- In lieu of thread sealant, straight threads are sealed with the use of a mechanical gasket design such as the following:

· Use a gasket or o-ring to seal.

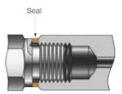

a) Bonded Washer

A self centering taper is used at the hex which centers a composite washer (typically metal/elastomer) to seal the surface surrounding the female thread.

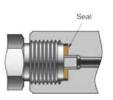

b) Metal Gasket Seal

A metal gasket (typically copper) is centered between the two mating surfaces in order to create a seal.

c) Metal Gasket

A gasket is inserted between the face of the male thread and the bottom shoulder of the female thread. A seal is created as the threads are tightened and force is applied to the gasket between the two mating surfaces.

4. UNF Thread

- Thread angle 60°
- This is a classified into UN, UNC and UNF. The standard is classified by the diameter of thread and the number of threads per inch.
- ASME B 1.1

Tube Standard Information

Tube Selection

Suitable tube selection is essential in performance of tubing system. When selecting tubing material, size and wall thickness, the installer must consider pressure, flux (flow), temperature, environment and compatibility of materials to system media.

Considerations in selecting tube:

- Quality of the tube materials and manufacturing method.
- 2. Thickness and outer diameter of tube.
- 3. Surface treatment of tube.
- 4. Hardness of tube.
- 5. Concentricity of tube.
- 6. Pressure coefficient as it relates to temperature change (see Table 2 below).

Tube Fabrication

It is important to ensure there is a sufficient length of straight tubing between the fitting and the first bend. This ensures proper connections and prevents leakage. Tube surface before and after fabrication must be free of surface damage or imperfections.

The minimum recommended straight length of tubing between the fitting and a bend:

Table 1

Tube O.D. (in)	1/8	3/16	1/4	5/16	3/8	1/2	5/8	3/4	7/8	1
L (in)	0.50	0.72	0.75	0.81	0.87	0.94	1.18	1.25	1.31	1.5

L=the distance from the the tube shoulder in the fitting body to the start of the bend.

Recommended Tube Specifications:

Carbon Steel Tubing

- · ASTM A179 or equivalent.
- Carbon steel tubing for an oil pressure usage of high quality, annealed and seamless.
- · Maximum hardness: HRB72.
- Tubing must be free from scars and suitable for bending and expansion works.

Copper Tubing

- · ASTM B68, B75 or equivalent.
- · Copper tubing of high quality, annealed and seamless.

Stainless Steel Tubing

- · ASTM A213, A269 or equivalent.
- Stainless steel tubing of high quality, annealed and seamless. (316, 304, 321, etc.)
- Hardness: HRB90 or less. HRB80 or less is recommended.
- Tubing must be free from scars and shall be suitable for bending and system expansion.

Monel Tubing

- · ASTM B165 or equivalent.
- 400 alloy tubing of high quality, annealed and seamless
- · Hardness: below HRB 75.
- Tubing must be free from scars and shall be suitable for bending and system expansion.

Pressure Grade Coefficient of Tubing due to Temperature Change:

Table 2

°F	°C	Copper	304SS	316SS	Monel
200	93	0.80	1.00	1.00	0.88
400	204	0.50	0.93	0.96	0.79
600	316		0.82	0.85	0.79
800	427	***	0.76	0.79	0.76
1000	538	122	0.69	0.76	
1200	649		0.30	0.37	

Multiply the allowable working pressure in Table 2 by the coefficient in Table 3 in order to determine allowable pressure at high temperature.

Example

SUS316

(3/8"O.D of tube) X (0.049" wall thickness) 1200°F: 4800 psi X 0.37 = 1776 psi

The applicable operation pressure of SUS316 tubing for wall thickness, 3/8"O.D x 0.049", is 1776 psi at 1200°F

Technical Data

Table 3 - Stainless Steel Tube Working Pressure Table

Use stainless steel tubing which is high quality (such as 304, 316, 316L, etc.), fully annealed and seamless ASTM A269, A213 or equivalent.

22				2300	2800	3000	3800	4000	4600	4800	5400		
25				2000	2400	2700	3300	3500	4000	4200	4700	5100	5200

^{*} Tubing working pressure(psi)

Allowable stress value between -20°F and 100°F (-28.9°C \sim 37.8°C) is 19,500 psi Safety factor is 4 (ultimate tensile strength is 75,000 psi)

- The above data is based on the minimum wall thickness and the maximum O.D. allowed by and under the ASTM A269 Standard.
- The data above does not account for the effects of corrosion or erosion of the tubing.

Single Ferrule Tube Fittings

Available in sizes from 1/16" to 1" in.

Features:

- Fewer parts, simpler design.
- Fewer seal points, fewer leak paths.
- Greater resistance to vibration.
- "Spring-Loaded" ferrule design for superior performance in thermal cycling.
- 25% less torque versus other designs.

Single Ferrule Design:

Superlok Canada offers both Double and Single Ferrule tube fittings. While the Double Ferrule design is more common, there are situations where Single Ferrule tube fittings are preferred. Superlok Single and Double Ferrule systems are fully interchangeable and provide high performance, leak-free connections. The Single Ferrule is specifically designed to withstand excessive vibration, high pressure cycling and is ideal for vacuum service.

Ordering Information:

The Single Ferrule tube fittings part numbering system is the same as our Superlok Tube Fitting, with the exception that you add an "S" as a suffix to tube size.

1. Type of Fitting

Referred to in the Superlok Tube Fitting catalog INDEX. Examples: SMC (male connector), SU (union), SME (male elbow), SUT (union tee)...

Bored-through Fittings for Thermocouples

SUPERLOK Bored-through Male Connectors accommodate thermocouples or dip tubes. To order, use TM as a suffix to the desired male connector ordering number.

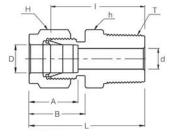

Note: the root diameter of the pipe thread end of male connectors makes it impractical to bore through all male connectors.

SMC Male Connector

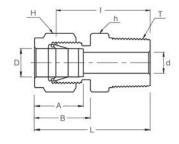

Connects Metric Tube To Female NPT Thread

SUPERLOK® Adapter Solves Alignment Problems

 Required installation is to connect tubing in direction shown, to a female port.

3. Connect Male Tube adapter to female port.

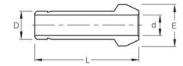

2. With pipe connection tight, the male elbow is pointing in the wrong direction for desired tubing run.

4. Connect union elbow to adapter by tightening SUPERLOK connection with wrench while holding elbow pointing in desired direction. Then insert tubing into the other end of the Union Elbow and make up fitting.

Installation Instructions

Port Connector

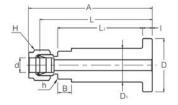

- Remove nut and ferrules from the first of two SUPERLOK ports to be connected.
- Slip nut (no ferrules) over machined ferrule end of port connector.
- Insert port connector into SUPERLOK port 1 and snug by hand. Tighten with wrench 1/4 turn only.
 For 1/8, 3/16 in., 2, 3, and 4mm tube fittings, tighten only 1/8 turn. Subsequent connections are made by tightening slightly with a wrench after tightening by hand.
- Insert other end of port connector into SUPERLOK port 2 and tighten nut 1-1/4 turns from finger-tight.
 For 1/16, 1/8, 3/16 in., 2, 3, and 4mm tube fittings, only 3/4 turn from finger-tight is necessary.

Lap joint flange tube connector provieds easy joint between process lines and instruments designed for use with 1/2in Lap joint flanges to ANSI B 16.5 or BS 1560

Flange Seal Finish

Two surface finishes, smooth or serrated, are available on the sealing surface of the stub end.

Smooth Identifier: SM Ra 3.2 ~ 6.3 micrometer

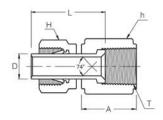

Serrated Identifier : SR Ra 6.3 ~ 12.5 micrometer

*Note: GROOVE identifies serrated surface finish

Mounting Dimensions for O-Seal Connectors

*ALLOW CLEARANCE FOR FULL THREAD

Installation Instructions

In order to prevent the leakage with Superlok O-Seal Fittings, the surface perpendicular to the axis of the thread should be flat. When installing an O-seal fitting, turn it until finger tight (the squeeze on O-ring can be felt during the last 1/4 turn). After finger tight installation, snug lightly with a wrench. When connecting the tubing to the Superlok connector, always use a back-up wrench on the O-seal fitting hex so it does not turn while the nut is being tightened. Also use a back-up wrench when disconnecting a tubing connection. For a raised surface, such as Figure 1, it is recommended that the flat surface have a diameter at least as large as dimension "A" for the various size O-seal fittings. This diameter is sufficient to allow metal-to-metal contact outside of the O-ring sealing diameter and to prevent O-ring extrusion at high pressure. Figure 2 is an O-seal fitting using with a counter bored or recessed hole. In this case, the diameter "B" is sufficient to allow the round shoulder of the O-seal to clear for proper installation. "D" gives the maximum depth that can be used with this diameter. Figure 3 shows the usage at deeper grooved or concaved area and "E" is the maximum depth that will allow a thin wrench (1/8") to hold the O-seal fitting while the Superlok connection is made to the tubing. The diameter "C" is sufficient to allow the hex of the fitting to turn in the recessed hole.

SAE/MS Straight Thread Positionable Elbows and Tees

Installation instructions

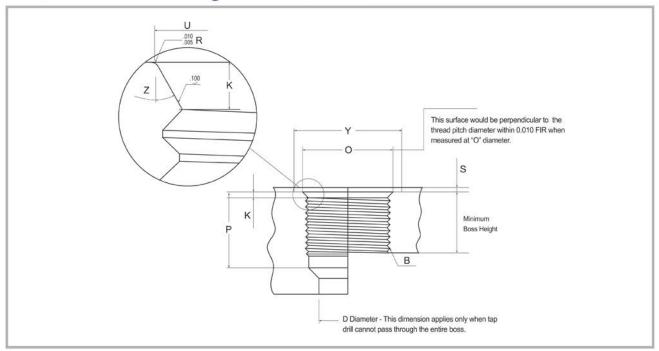

- 1 Lubricate O-ring with suitable lubricant for system fluid, environment and for the O-ring material. Viton® is standard other materials are also available.
- 2 Turn the fittings into the straight thread boss until the metal backup washer contacts the face of the boss. At this moment, O-ring gets into inclined groove.
- 3 Until Superlok's end is oriented in the proper direction, position the fittings by turning them counter clockwise (no more than 1 turn).
- 4 Tighten the fittings with wrench and back up wrench until the washer contacts the mating surface and O-ring is compressed slightly.
- * Note: SAE/MS' POSITIONABLE TEE and ELBOWS are compatible with SAE J1926, MS16142, or o-ring female straight thread for JIS boss.

- Diameter U shall be concentric with thread pitch diameter within 0.005 full indicator reading (FIR) and shall be free from longitudinal and spiral tool marks. Annular tool marks shall be less than 100micro inches.
- This is the maximum recommended spotface depth to permit sufficient wrench grip for proper tightening of the fitting or locknut
- If the surface of boss surface is machined, dimensions Y and S does not need to be applied.
- Bottoming tap shall be used to satisfy the tap drill depth. Where standard taps are used, the drill depths must be increased accordingly

Note: SUPERLOK® weld ends are constructed per schedule 80 wall thickness or greater. Weld End: ANSI B31.1 and B31.3

Weld end SUP€RLOK® Usage Information:

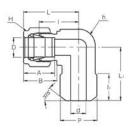

- Remove nut and ferrules from body to protect them from the weld heat.
- · Protect the threads and seat of the fitting body during welding.
- · Correct weld procedure is required during and after welding. Suitable heat treatment must be applied in accordance with industry standard.

OTHER PRODUCTS

Superlok Tube Fittings

High quality dual and single ferrule Tube fittings for the most reliable tube connections. Our tube fitting are available in a broad range of sizes, materials and configurations.

Valves

A full range of instrument ball valves, needle valves, check valves and relief valves. Our instrument valves are available in multiple configurations, end connection sizes and materials.

Tubing

High quality stainless steel and exotic alloy tubing for industrial process and instrumentation. We proudly represent Alleima (Sandvik), the world leader in development of stainless steels and advanced alloys for industry.

UHP Fittings & Valves

Ultra-High Purity fittings & valves are used to connect tubing in industries that require extremely clean and contaminant-free systems. The process involves electro-polishing and ultrasonic cleaning with deionized water.
