

Remove Deep Stains on Porous Tile and Natural Stone

Tools You Will Need:

Scrub brush or nylon pad, rubber gloves, and at least 2 white cotton towels.

Recommended Products:

Natural Stone Deep Clean or product that is safe or recommended for use on natural stone surfaces.

What To Do:

1. Test a small area with your cleaning solution and wait 24 hours to ensure product does not cause discoloration.
2. Sweep or vacuum over the affected area to remove all loose debris. Put on rubber gloves for protection.
3. Cover the stain with undiluted Natural Stone Deep Clean, or follow the instructions provided on your other cleaning product.
4. Let the solution sit over the stain for 1-2 hours without letting it dry. The stain should lessen in visibility.
5. If two hours have passed and your stain is still visible, use the scrub brush or nylon pad to work the stain out.
6. Wipe up the residue with one of your white cotton towels and rinse the area with clean water.
7. Dry the surface thoroughly with your second white cotton towel.
8. Repeat as necessary to fully remove the stain.

**Area may appear darker from moisture and the tile should fully dry out in 2-4 days. Keep traffic away from treated area until dry.*
