

# Dipladenia

## Care Guide

### Light

Dipladenias perform best in full sun and requires between six and eight hours of direct sunlight per day.

### Water

Once established, watering every eight to 10 days is sufficient. In summer, the plant should be watered more frequently.

### Temperature

Dipladenias need to be environments with temperatures above 50° F.

### Food

To keep the plant healthy, regular application of fertilizer is needed. You can use any liquid plant food or slow-release fertilizer. Once or twice a month feeding will do but make sure to do this in Spring, during the growing season.

### Toxicity

Mildly toxic to humans and pets if ingested.

### Growers Tips

As a tropical plant, dipladenia doesn't tolerate frost. If you live in a cold-winter climate, it's best to consider dipladenia an exotic annual or bring it indoors as a houseplant for a sunny window until temperatures warm again in spring.
