

Dwarf Jade Tree Care Guide

Light

Does best in full sunlight. You will know if your jade tree is getting enough light if its leaves develop red tips or edges.

Water & Humidity

Let the soil dry out a bit between waterings. If it's a colder month Jade trees can go about 3 weeks without being watered. Prefers lower humidity around 30-50%.

Temperature

Ideal temperature is 60-70°F

Food

Would benefit from a monthly feeding from spring to fall. You can use a standard houseplant fertilizer or succulent plant food.

Toxicity

Toxic to humans and pets if ingested.

Growers Tips

Because the Jade tree is a succulent, it retains water in its trunk and branches. The water retention makes the tree limbs heavy which naturally bends the trunk and branches. It responds very well to pruning, and you should prune it regularly to force it to grow branches, especially in the lower part of the trunk.

Repotting a Jade tree should be done every-other-year in spring. Be sure to use a well-draining soil mixture and don't water the soil for about a week after repotting. This allows the cut or damaged roots to dry and callous. Watering after repotting leads to root rot, which can severely damage your jade tree.
