

Emerald Green Arborvitae Care Guide

Light

Emerald Green Arborvitaes are highly adaptable and can grow well in the spectrum from full sun to partial shade. These trees do best with a minimum of four hours of direct and unfiltered sunlight per day.

Water

Water every day or two for the first 2-3 months, until the plants are established. After that, they should get one inch of water every week or ten days.

Temperature

Tolerates heat and drought once established and is cold-hardy to -40°F.

Food

Arborvitaes do not necessarily need fertilizing, but if you want yours to grow faster and fuller, you can add fertilizer to its soil yearly in the spring. Slow-release fertilizer with a 10-10-10 ratio is best.

Toxicity

Mildly toxic to animals if ingested.

Growers Tips

The emerald arborvitae grows to a height of 10–15' and a spread of 3–4' at maturity. The emerald arborvitae grows well in acidic, loamy, rich, sandy, silty loam and well-drained soils. Grows in a pyramidal shape. Does not discolor in winter like other arborvitae.
