

# Tillandsia Air Plant Care Guide

## Light

Needs bright, indirect or filtered light.

## Water & Humidity

Water your air plant by heavily misting it 2-3 times per week, or soaking it in water for about 10 minutes once per week. Be sure to allow your plant to completely dry in between watering.

## Temperature

Ideal temperature is 50-90°F. Make sure to avoid frost.

## Food

You can fertilize by adding a pinch of Bromeliad or Orchid fertilizer to your mister or a low nitrogen fertilizer formulated for air plants.

## Toxicity

Non-toxic to humans and pets.

## Growers Tips

The water you use is important. Never use distilled water! Softened water is a not good either because of the salt content. Filtered water, tap water that has sat long enough for the chlorine to dissipate, and bottled water are all fine.
