Seed Warranty: Southern States® and its dealers warrant the seeds sold in this container are as represented on the label and have been labeled as required under State and Federal seed laws. This express warranty is in lieu of all other warranties whether expressed or implied as to merchantability or fitness. Our liability in this transaction is limited in amount to the purchase price of the seeds. There is no warranty unless patron reports within 30 days after discovery of conditions indicating unsatisfactory results. No representative of Southern States or its dealers may vary any of the foregoing.

Contents

The work in the garden never seems to end, and often doesn't! On the following pages we'll offer helpful advice to keep your vegetables growing strong.

**Disclaimer: The following are recommendations for the mid-atlantic and south eastern regions of the United States. Climate and dates may vary per year. Be sure to verify weather conditions for your area. A climate zone map can typically be found at your local county extension office. You can also come into your local Southern States® for advice and information on growing your garden.*

FREQUENTLY ASKED QUESTIONS ABOUT SOUTHERN STATES BRANDED VEGETABLE SEED

Are they certified organic?

None of the Southern States vegetable seeds are certified organic.

Are Southern States Vegetable Seeds Genetically Modified (GMO)?

The Southern States-branded vegetable seeds featured in this catalog and offered for sale on our retail shelves are not genetically modified.

As a farmer-owned cooperative, Southern States aims to provide a variety of products and services to meet our member and customer needs that are economically feasible, scientifically sound and environmentally responsible. Therefore, we do offer a small selection of genetically modified sweet corn currently available in the marketplace (see page 62), which are sold strictly in compliance with state and federal regulations.

What is a hybrid variety?

Hybrid is a term that is often confused with GMO products. A hybrid variety is produced by crossing parents with desirable traits. Hybridization is a process that can occur naturally in the environment or through human selection for the desired traits. A hybrid can be organic or conventional depending on how they are grown, but a hybrid cannot be an heirloom. Saving seeds from hybrid varieties is not recommended because the resulting crops will not share the same traits as the first hybrid crossing.

Source: <https://organicforecast.org/2015/01/heirloom-hybrid-organic-gmo-what-does-it-all-mean/>

What is an open-pollinated variety?

The offspring of open-pollinated varieties express traits similar to the parental lineage so seed from these varieties can be collected and replanted in the next season.

Gardening Articles

Are they hybrids?

Some of our Southern States vegetable seed varieties are hybrids and some are open-pollinated. Hybrid varieties are designated by the word “hybrid” or symbols “HY” or “F1” in the product name. If there is no hybrid designation, the variety is open-pollinated.

Are they heirlooms?

Unlike certified organic seed, “heirloom” is a relative term without legal definition set by the USDA. Most of the industry accepts that heirloom is an open-pollinated variety that has been handed down for generations. Generally, open pollinated varieties developed before 1957 are considered to be heirlooms. Southern States offers a wide range of open-pollinated seeds that have been grown for many generations. The varieties we consider to be heirlooms are designated in our Vegetable Grower’s Handbook.

Are they treated?

All of the sweetcorn, English peas and lima beans are treated, with the exception of the Alaska pea variety.

All of our garden beans and cowpeas are untreated except the Strike bean, Queen Ann blackeye and Zipper cowpea varieties.

Some varieties of small seeded items may be treated as well depending on the variety & supplier.

Why do we use seed treatment?

We use seed treatment as an extra layer of protection to help with seed germination and seedling health. The treatment defends the seed from fungal pathogens and insect pests. This provides customers an optimal environment to grow a full, healthy crop.

Can items that are listed in the Vegetable Grower’s Handbook but are not stocked at the local store location be ordered?

Yes! Please ask a store associate to help you place a special order for a non-stock item. *Note: Additional freight charge may apply.*

INOCULANTS

When it comes to preventing disease and promoting growth in your plants, who couldn't use a helping hand? By forming a partnership with your plants, inoculants work naturally to get those jobs done.

What are inoculants?

We often think of bacteria, fungi or other soil microbes as unsavory characters; many types of these life forms can help us out. Some form relationships with plant roots, encouraging them to grow while making water and important nutrients more available to the plant. Many live in the soil, breaking down nutrients like phosphorous, so plants can more easily absorb them into their systems while others attack plant pests before they become harmful.

Inoculants are specially formulated organism combinations tailored for each type of crop. Depending on the type of inoculant, inoculants can be applied to seeds or sprayed on the ground. By "inoculating," or treating seed or soil with these organisms, the soil environment and crops are both improved. This leads to stronger plants and increased yield.

What can inoculants do?

Inoculants are effective in treating many plant problems.

- Biofertilizers are one type of inoculant that increases plant growth. Some bacterial inoculants, called rhizobacterial inoculants, can enhance the availability of nutrients like nitrogen and phosphorous. Other types of bacteria form symbiotic relationships with roots, increasing nitrogen nutrition, plant growth and grain yield. Some bacteria break down soil nutrients to simpler forms for easier plant uptake.
- Biopesticides colonize around the plant and help suppress harmful organisms by killing them or consuming their food resources to starve them. Many bacteria, fungi and nematodes make great biopesticides.
- Another type of inoculant stimulates plants' defenses to pests and pathogens, making it harder for these to attack the plants.

Inoculant application and storage

Inoculants are available in liquid, solid or freeze-dried form. Growers can purchase pre-inoculated seeds or mix the inoculants with seeds in a planter box before planting. Because inoculants are living organisms, inoculated seeds or mixtures should always be stored in a cool, dark, dry place.

What are the best types of inoculants for my crop?

With so many choices, selecting the best inoculants for your crop can be confusing. On Page 7, we show the different inoculants suited for various plant types.

Gardening Articles

Plant Type	Inoculant	Result
Ornamental	<i>Gliocladium sp.</i>	Antifungal
	<i>Trichoderma spp.</i>	Promotes plant growth
Beans and Peas	<i>Rhizobium</i>	Fixes nitrogen
	<i>Pseudomonas spp., Bacillus spp.</i>	Increases root growth
	<i>Bacillus subtilis</i>	Increases plant disease resistance
Corn, Rice, Wheat	<i>Azospirillum, Azobacter, Bacillis,</i> and <i>Burkholderia</i> strains	Fixes nitrogen
Many Vegetables	<i>Bacillis subtilis</i>	Increases plant disease resistance
	<i>Trichoderma spp.</i>	Promotes plant growth
	<i>Pseudomonas spp.</i>	Promotes plant growth, anti-fungal
	<i>Gliocladium spp.</i>	Anti-fungal
Good for Most Crops	<i>Mycorrhizae</i> fungi	Increases nutrient and water uptake, increases disease and drought resistance
	<i>Bt</i>	Kills caterpillars, beetle larvae, fly larvae and nematodes
	<i>Streptomyces lyclicus, griseoviridis</i>	Promotes plant growth, anti-fungal

Pea & Bean Inoculant (Treats Up To 50lbs.)

Using an inoculant results in better plant and root system growth for legumes. Legume plants produce their own nitrogen through a relationship with bacteria called Rhizobia which is in the inoculant as well as in the soil, but, the Rhizobia in the soil are not as active in cool, wet soils. Adding the inoculant gives your legumes a jump start. (This is an all-natural product, but is not organically certified).

878100

Fix-N-Grow Legume Inoculant (Counter Display of 30 Packets)

Fix-N-Grow is a mixture of various beneficial bacteria needed by beans, peas and cowpeas and suspended in easy-to-use granules. Fix-N-Grow lets your customers take advantage of naturally occurring nitrogen in the atmosphere, most of which is formed by lightning, and put it where it will do the most good.

pH LEVELS IN SOILS AND SOIL TESTING

Gardeners boasting state-fair-sized flowers and growers with consistently healthy row crops rely on more than sunshine, water and a green thumb to keep their plants healthy; they know that one secret to success lies with an annual soil test.

Where to find a soil test kit?

A soil test can be acquired at your local Southern States store. Simply stop in and ask one of our team members for a soil sampling kit - and feel free to ask questions. Our knowledgeable staff will help walk you through what you'll need to do. Soil kits give you the information you'll need to get started. Once your soil test is complete, you'll have a full recommendation on what to do to get your lawn or garden growing great!

Testing Your Soil

According to the Clemson University Cooperative Extension program, gardeners should test their soil once each year, ideally in the fall or at least two months before planting to allow time for any necessary lime or other recommended amendments to react with the soil. Accurate results depend on adhering to proper soil testing methods. Follow these guidelines for an accurate soil reading:

1. Use clean tools with no soil residue. Stainless steel or chrome-plated soil probe, hand garden trowel, shovel or spade work best. Avoid using brass, bronze or galvanized tools, as they will contaminate samples with copper and/or zinc.
2. On a day when your soil isn't too wet or too dry, divide your landscape into functional areas (e.g.: vegetable garden, lawn, flower bed and the area closest to your house) and sample those areas individually.
3. Gather at least 10 subsamples from each functional area. Mix the subsamples together in a clean bucket to yield a representative soil sample. The representative soil sample should be at least 2 cups.
4. Collect soil from the appropriate depths. For established lawns, sample soil 2-4 inches from the ground. Soil from vegetable and flower gardens should be 6-8 inches below ground or the tillage depth. And around trees and shrubs, soil should be collected 6 inches below ground.

Gardening Articles

Analyzing the Results

When you're all done, bring in your soil sample to your local Southern States. We'll ship the soil to a lab which then will analyze your results and provide a soil care recommendation, complete with products and application details. A Southern States team member will be glad to review your personalized plan with you—as well as answer any questions you might have.

Your soil test results reveal a few key facts. In addition to indicating the actual pH value, it shows how acidic or basic your soil is and recommends the necessary amount of fertilizer or lime (if needed) per 1,000 square feet that should be added to keep your plants healthy.

The pH scale ranges from 0 to 14. If your soil has a pH less than 7, it is more acidic, while numbers greater than 7 indicate alkaline soil. Azaleas, rhododendrons, blueberries and conifers thrive in acid soils with pH levels around 5, whereas vegetables, grasses and ornamentals prefer only slightly acidic soils, with a pH ranging from 5.8 to 6.5.

If your soil is too acidic, you may need a limestone application. Specific lime requirements (often referred to as LR) are based on each plant's needs. Lime requirements generally indicate the amount of ground limestone that is necessary to raise your soil to a pH level of 6.5. For best results, work the lime into the soil by tilling it under, as surface-applied lime integrates with the soil at a low rate.

Gardening Tips

CHECKLIST FOR THE PERFECT GARDEN

There is nothing nicer than harvesting your own produce. Healthy fresh vegetables picked straight from your plot retain considerably more of the nutrients that are often lost in transport and storage. Furthermore, a comparatively small investment in seeds and fertilizer added to a little diligent elbow grease can save you hundreds, perhaps even thousands, of dollars off your grocery bill. Starting and maintaining your own garden is easy and fun.

With Southern States, you'll have everything you need to enjoy fresh produce from your own garden. Start with the check list below to begin planning your garden!

- Start planning your garden in January
- Choose a well-drained, sunny location with sandy loam soil
- Test soil (see store for more information)
- Apply lime and fertilizer in accordance with soil test results
- Choose your vegetables
- Start seeds indoors to maximize growing season
- Till the garden
- Mark off rows
- Plant the seeds
- Water the seeds
- Thin your plants and begin weeding
- Check for disease and pests for immediate control
- Apply additional fertilizer
- Support plants like tomatoes as they grow
- Harvest
- Preservation-canning and freezing

PLAN YOUR GARDEN

To start planning your garden, you should determine the plant hardiness zone in which your garden is located. In the U.S. there are 11 plant hardiness zones as defined by the United States Department of Agriculture (USDA), which are also known as growing or climate zones. There is no hard and fast rule that says that one species of plant will necessarily flourish or fail outside of its hardiness zone, and it may often be worth an experiment to go a zone either way now and again. However, the plant hardiness zones are considered to be fairly reliable guidelines. Reference your local extension service about planting in your zone. To print out our gardening grid to assist in planning your garden please visit:

www.southernstates.com/articles/gardening-grid.aspx

When to Plant

Knowing when to plant is critical to a successful garden. This chart indicates the optimum month to plant each variety, based on the upper south climate zone. For planting times in other climate zones, visit us at southernstates.com or contact your local Southern States® dealer.

JANUARY			JULY		
Soil Test			Beans, Bush	Carrots	Salsify

Kale	1 to 2 oz	March, August and September	3	1½ to 2½	12 to 18
Lettuce	¼ oz	Early March to May and Late August	2 to 3	1½	8 to 10
Mustard	1 oz	Early March, April and Late August	2 to 3	1 to 2	4 to 6
Okra	1 oz	May and June	3	2 to 3	18 to 24
Onions	1 to 2 lb	March and April	2 to 3	1 to 2	3 to 4
Winter Onions	2 to 3 lb	September to November	3	1½ to 2	4 to 6
Parsley	1 oz	March and April	2	1 to 1½	4 to 6
Parsnips	½ to 1 oz	March and April	2½ to 3	1½ to 2	4 to 5
Peas	1 to 2 lb	February to May	3	2 to 3	1 to 3
Peppers	66 plants	May	3	2 to 3	18
Potatoes	½ peck	March to May	3	2½ to 3	12
Pumpkins	½ oz	May	6	4	48
Radishes	1 oz	Early March to May, Late August and September	2 to 3	1 to 1½	2 to 3
Rhubarb	25 to 30 roots	Early March and April	4	4	36 to 48
Rutabaga	1 oz	Late October and November	2½ to 3	2 to 3	4 to 6
Salsify	2 oz	June and July	2½ to 3	1 to 2	4 to 5
Spinach	1 to 2 oz	Early March, April, Late August and September	2 to 3	1½ to 2	4 to 8
Squash (Summer)	½ oz	April to June	5	3 to 5	36 to 60
Squash (Winter)	1 oz	April and May	5	3 to 5	36 to 60
Sweet Potatoes	66 to 100 plants	May and June	3 to 4	3	12 to 18
Swiss Chard	2 oz	March and April	3	1½ to 2	6 to 8
Tomatoes	33 to 40 plants	Early May to Late July	3 to 5	2½ to 3	30 to 36
Turnips	1 oz	March to August	2½ to 3	1½ to 2	4 to 6
Watermelons	½ oz	May and June	6	4 to 5	36 to 72

When to Harvest

To get the best taste, texture and cooking quality, vegetables should be harvested at optimum maturity. This chart indicates the best stage of growth to harvest. Another aid to planning a successful garden is the “Days to Maturity” date printed on each seed package and in this guide. This is based on normal growing conditions and will indicate how many days until the plant reaches optimum maturity.

vegetable	part eaten	too early	optimum maturity	too late
Artichoke, Globe	Immature bloom	Small flower buds	When buds are 2" to 4" in diameter	Large buds with loose scales or bracts
Asparagus	Stem	Insufficient length	6" to 8" long; no fiber	Excess woody fiber in the stem
Beans, Lima	Seed	Insufficient bean size	Bright green puffy pod; large seed	Yellow pods
Beans, Pole Green	Pod and seed	Insufficient size	Bean cavity full; seed ¾ grown	Large seed; fibrous pods
Beans, Snap Bush	Pod and seed	Insufficient size	Turgid pods; seeds just visible	Fibrous pods; large seed
Beets	Root and leaves	Insufficient size	Roots 2" to 3" in diameter	Pithy roots; strong taste
Broccoli	Immature bloom	Insufficient size	Bright green color; bloom still tightly closed	Loose head; some blooms beginning to show
Brussels Sprouts	Head	Insufficient size; hard to harvest	Bright green; tight head	Loose head; color changes to green-yellow
Cabbage	Head	Insufficient leaf cover	Heads firm; leaf tight	Loose leaf; heads cracked open
Cantaloupes	Fruit	Stem does not want to separate from fruit	Stem breaks away easily and cleanly when pulled	Yellow background color; soft rind
Carrots	Root	Insufficient size	½" to ¾" at shoulder	Strong taste; oversweet
Cauliflower	Immature bloom	Head not developed	Compact head; fairly smooth	Curds open; separate
Celery	Stems	Stem too small	Plant stands 12" to 15" tall; medium-thick stem	Seed stalk formed; bitterness
Collards	Leaf	Insufficient leaf size	Bright green color; small midrib	Large midrib; fibrous
Corn, Sweet	Grain	Grain watery; small	Grain plump; liquid in milk stage	Grain starting to dent; liquid in dough stage
Cucumber	Fruit	Insufficient size	Dark green skin; soft seeds	Skin beginning to yellow; hard seeds
Eggplant	Fruit	Insufficient size	High glossy skin; side springs back when mashed	Brown seeds; side will not spring back when mashed
Lettuce, Head	Leaves	Head not fully formed	Fairly firm; good size	Heads very hard
Okra	Pod	Insufficient size	2" to 3" long; still tender	Fiber development; tough pods
Onions, Dry	Bulb	Tops all green	Tops yellow; ¾ fallen over	All tops down; bulb rot started
Peas, English	Seed	Peas immature and too small to shell	Peas small to medium; sweet bright green	Yellow pods; large peas
Peas, Southern (green)	Seed and pod	Peas immature and too small to shell	Seeds fully developed but still soft; soft pods	Hard seeds; dry pods
Pepper, Pimiento	Pod	Insufficient size	Bright red and firm	Shriveled pod
Pepper, Red Bell	Pod	Chocolate-colored pods	Bright red and firm	Shriveled pod
Potato, Irish	Tuber	Insufficient size	When tops begin to die back	Damaged by freezing weather
Potato, Sweet	Root	Small size; immature	Most roots 2" to 3" in diameter	Early plantings get too large and crack; damaged by soil temperature below 50°F
Rhubarb	Stem	Small size; immature	Stem 8" to 15" long is best	Fleshy stem becomes fibrous
Soybeans	Seed	Seeds not developed	Thick pods; bright green	Dry pods; seed shatters out
Squash, Summer	Fruit	Insufficient size	Rind can be penetrated with thumbnail	Penetrating with thumbnail is difficult; large seed
Squash, Winter	Fruit	Soft rind	Rind difficult to penetrate with thumbnail	Damaged by frost
Tomatoes	Fruit	<p>May be harvested in 3 stages:</p> <p>Mature green - tomato is firm and mature, color changes from green to light green, no pink color showing on blossom end. These tomatoes will store 1 to 2 weeks in the refrigerator.</p> <p>Pink - pink color about the size of a dime on the blossom end. At room temperature, these tomatoes will ripen in about 3 days.</p> <p>Ripe - tomato is full red but still firm. Should be used immediately.</p>		
Watermelon	Fruit	Green flesh; green stem is difficult to separate	Melon surface next to the ground turns from a light straw color to a richer yellow	Top surface has a dull look

Beans

Beans thrive in warmer weather; therefore they should not be planted until all danger of frost has past. Lima beans prefer even warmer conditions than garden beans, with a minimum soil temperature of 65° F. They should be planted in full sun, well-drained soil. For bush beans/limas, plant the seeds about 1 to 2 inches deep, 2 to 3 inches apart with rows being 24 to 36 inches apart. Once true leaves have developed, you can thin to about 6 inches apart. For pole varieties, plant about 1 to 2 inches deep, 6 to 8 inches apart with rows being 30 to 48 inches apart.

Whether you are planting pole beans or pole limas, don't forget to utilize some type of support when you plant the beans. All beans need adequate moisture, so you may need to water at least once a week or more depending on weather conditions.

Beans as a whole are one of the easier vegetables to grow and some type of bean or relative is native to just about everywhere in the world, which is great for beginning gardeners.

For more cultivation information: www.southernstates.com/articles/how-to-grow-pole-beans.aspx

BUSH BEANS

Blue Lake 156

Blue Lake 156

Matures in 65 days

An improved variety with uniform, straight 5½–6 inch pods and distinctive Blue Lake flavor.

½ lb..... 020-40615
1 lb..... 020-50615
5 lb..... 020-60615
50 lb..... 020-80615

Blue Lake 274 ①

Matures in 61 days

The lush green plants are true bush-type, wider than they are high, with round, 5 to 5½ inch long dark green stringless pods. Slow seed development and fiber-free nature make Blue Lake 274 a flavorful favorite.

½ lb..... 020-40611
1 lb..... 020-50611
5 lb..... 020-60611

Burpee Stringless Green Pod ① ②

Matures in 53 days

Erect, vigorous bushes grow up to 20 inches high and stand up well under multiple pickings. The stringless medium green pods are round, pointed and curved forward. Delicious fresh or canned.

½ lb..... 020-40010
1 lb..... 020-50010
5 lb..... 020-60010

Contender

Contender ②

Matures in 55 days

The attractive, nearly straight, and slender round pods are a rich dark green color and have the added bonus of being stringless. Bush is dark green, leafy and grows to 18 inches.

½ lb..... 020-40605
1 lb..... 020-50605
5 lb..... 020-60605

Dark Red Kidney

Matures in 95 days

Dark red beans used in cooking. Used exclusively for dried beans.

1 lb..... 020-50606
5 lb..... 020-60606

Beans

Dwarf Horticultural Long Pod (Taylor Strain)

Matures in 65 days

Fresh shelled Long Pods cook similarly to limas. The vigorous bushes reach 15 to 18 inches in height and produce ample light green stringy pods that turn white with splashes of crimson as they mature.

1/2 lb..... 020-40003

1 lb..... 020-50003

5 lb..... 020-60003

French Horticulture

French Horticulture

Matures in 70 days

This very productive “cranberry bean” variety has been used primarily for shelling. It is very similar to Dwarf Horticulture. The vines reach 30 to 36 inches.

1/2 lb..... 020-40622

1 lb..... 020-50622

5 lb..... 020-60622

Goldrush

Goldrush

Matures in 56 days

An attractive yellow wax bean with smooth, straight, slender and round pods.

Has a highly concentrated set carried medium-high on the large-framed bush plant. Well-suited for mechanical or hand harvesting.

1/2 lb..... 020-40601

1 lb..... 020-50601

5 lb..... 020-60601

Jade

Jade

Matures in 60 days

Produces abundant yields over multiple harvests of long, round straight pods with exceptional sweet flavor, tenderness and dark green color. A strong, upright, bush-type plant holds pods above the ground which reduces the likelihood of curling and tip rot.

1/2 lb..... 020-40623

1 lb..... 020-50623

5 lb..... 020-60623

Kentucky Wonder Bush 125

Matures in 59 days

These heavy-yielding beans are outstanding fresh or for canning or freezing. Abundant crop of 6 to 7 inch, medium-green pods. Seeds are white.

1/2 lb..... 020-40007

1 lb..... 020-50007

5 lb..... 020-60007

Mountaineer Half Runner

Mountaineer Half Runner

Matures in 56 days

A delicious favorite for many years. Pods are 4 inches long with some strings but free of fiber. Bush is full, leafy, vigorous and resistant to Common Bean Mosaic. Stake to sustain production.

1/2 lb..... 020-40002

1 lb..... 020-50002

5 lb..... 020-60002

Beans

Roma II

Matures in 59 days

A high yielding, disease-resistant snap bean, Roma II is tender, meaty and flavorful. The pods are slow to develop seed and fiber, ensuring high eating quality for 3 weeks or longer. Strong plants keep beans off the ground and free of dirt.

1/2 lb 020-40011

1 lb 020-50011

5 lb 020-60011

Royal Burgundy

Royal Burgundy

Matures in 51 days

The bean with its own built-in timer! The bright purple pods turn a brilliant green when tender-crisp. Plants are upright and produce colorful, easy-to-see pods that are 5 to 6 inches long.

1/2 lb 020-40013

1 lb 020-50013

5 lb 020-60013

Slenderette

Matures in 53 days

Slender, smooth stringless pods are glossy and dark green. Very high yield and quality with resistance to Common Bean Mosaic-NY 1, 15 strains, pod mottle and curly top virus. Strong, erect 20 inch plants easily support the bountiful crop of 5 inch beans.

Beets

Timeliness is essential for a good harvest. Sow beets in early spring or late summer. Plant $\frac{1}{2}$ inch deep and keep well watered throughout the growing season. Sow beets thickly and then thin the plants several times, once when clusters are established and again when beets are about 4 inches tall. Allow enough space for each beet plant to have room for its roots.

Crosby Egyptian

Matures in 55 days

A top choice for home growers due to its early arrival in the garden plus its appealing red flesh, fine texture and sugary sweet taste. The smooth, round, flat shape with its slender taproot make it desirable as a bunching type that market growers will appreciate. The home gardener will appreciate its great freezing qualities.

Green Sprouting Calabrese

Green Sprouting Calabrese

Matures in 80 days

An open pollinated variety of broccoli with large blue-green central heads. It is a heavy producer with good side shoot production.

1/4 oz 020-10068

1/4 lb 020-30068

Cabbage

Cabbage comes in a variety of colors (green, red or purple) as well as a variety of head shapes. Choosing the proper variety for your area will make growing cabbage in the garden a relatively easy task. It is best to start seeds indoors by sowing them about $\frac{1}{2}$ inch deep, and then transplant the plants to the garden. Place the plants in a location that receives full sun to slight shade. Early cabbage plants should be planted in the garden early in spring so the heads will mature prior to the heat of the summer. Late cabbage varieties can be planted in the summer to produce heads in the fall. You will want to space the plants about 12 to 24 inches apart. Fertilize and water the plants to ensure the best possible results. Harvest cabbage when the heads have formed and are firm. For more cultivation information: www.southernstates.com/articles/growing-cabbage.aspx

Charleston Wakefield

Charleston Wakefield

Matures in 70 to 75 days

Cucumbers

Cucumbers are grouped into 2 categories: pickling and slicing. Depending on what you plan to do with your harvest, you will want to choose the right one. However, whichever type you choose, they will both need to be cared for in the same manner. Plant your seeds about 1 to 1½ inches deep in late spring or early summer, when all chances of frost have passed. You will want to plant them 36 to 48 inches apart, as cucumbers take up a lot of room in your garden. However, if space is an issue, you can put up some type of support and have the plant grow upright instead of along the ground. Cucumbers are susceptible to disease and insect damage, so you will need to monitor your plants regularly for any problems. Harvest cucumbers when fruit is still immature to maximize the number of cucumbers produced. Harvesting regularly can help to keep your plants producing for a longer period of time. For more cultivation information: www.southernstates.com/articles/how-to-grow-cucumbers.aspx

Calypso Hybrid

Calypso Hybrid

Greens

Whether you prefer good old-fashioned spinach, or the more exotic flavor and look of swiss chard, it helps to know what conditions your greens prefer. Use the chart below to ensure all your greens grow strong to the finish.

vegetable type	growing suggestions
collards	Plant collards in spring or make the most of their heat tolerance and stagger plantings by seeding the vegetable in June, July and August for a continuous supply. For the best flavor, the leaves should be picked while still tender.
kale	Kale cannot tolerate hot weather, but doesn't mind the cold. In fact, it tastes even better when nipped by a frost. Sow early in spring in rows 2 or 3 feet apart. The vegetable may also be sown in October for spring use if covered with straw. Kale is rich in vitamins A and C, high in potassium, calcium and iron, and is a good source of fiber. It maintains flavor best when frozen.
mustard	Sow seed thinly as early in the spring as weather permits, in rows about 1 foot apart. For late fall use, sow during August. 1 ounce sows 100 row feet.
spinach	Germinates best in nitrogen-rich soil that is rather cool. Sow 1 inch deep, covering firmly, in rows 1 foot apart or in beds for better use of space. For fall plantings, sow more thickly as germination is slower in warmer soil. Keep well-watered and weeded.
swiss chard	Feeling a bit adventuresome? As soon as the ground can be worked in the spring, lay your rows 18 to 24 inches apart. Sow the seed immediately and cover with 1 inch of soil. Thin to allow 4 or 5 inches between plants. Harvest when plants reach 7 to 9 inches tall, using the outer leaves first to ensure always having young and tender leaves. Swiss chard will winter over in milder areas.
turnips	Turnips hit their peak just about the time other vegetables in the garden succumb to frost, but they can also be planted in the spring. In either case, turnips like frequent cultivation and temperatures under 75 degrees. To grow spring turnips for the roots rather than for greens, plant the seeds in hills located 12 to 18 inches apart and cover with $\frac{1}{2}$ inch of soil. After they are up and growing, thin to 4 or 6 inches apart. If growing mainly for the tasty tops, however, sow thickly and don't thin as much. Harvest while small for best flavor and texture. For a winter crop, sow in late July or early August in rows or just broadcast the seed.

1/4 oz 020-10338

1/4 lb 020-30338

1 lb 020-50338

Herbs

Many herbs can be grown successfully with minimum effort. When selecting an herb garden site choose one that is well drained with average soil fertility. If conditions are too wet herbs won't grow too rich and the plants will produce excessive foliage with poor flavor. Herbs can be sown in containers or outdoors, covering lightly, but may need to be thinned after emergence depending on the location. Harvest mature herbs in the morning, just after the dew has dried, but before the sun gets hot to maximize concentration of essential oils and thus flavor.

Basil

Basil

Matures in 45 days

Basil is a popular and often used herb. Besides being wonderfully aromatic, the lush dark green leaves are a nice contrast in the garden and can easily be preserved.

1/4 oz 020-10217

Forest Green Parsley

Matures in 70 days

Leaves are finely cut with a triple curl, making it superior for garnish. Plants are erect and vigorous.

1/4 oz 020-10211

1/4 lb 020-30211

Lettuce

Lettuce have small root systems and require a good supply of nutrients in the surface soil. The soil pH range for lettuce is between 6.0 and 7.0. Try to select a plot that is well drained and moist rather than soggy. Seed leaf lettuce 8 to 12 inches apart in rows that are 12 to 24 inches apart and seed head lettuce 12 to 15 inches apart in rows that are 30 to 42 inches apart. Both varieties will be happy being planted $\frac{1}{4}$ of an inch to $\frac{3}{8}$ of an inch deep. For more cultivation information: www.southernstates.com/articles/growing-lettuce.aspx

Melons

When growing melons, weather is key. The warmer it is, the sweeter the melons will be. Plant melons in late spring to early summer, when air and soil are very warm. It will help to use plenty of compost or manure, then cover with black plastic. Transplanted seedlings can be placed into holes punched in the plastic if necessary. Sow $\frac{1}{2}$ inch deep in hills that are 6 to 8 feet apart. For cantaloupes and muskmelons, plant 10 to 12 seeds per hill, then thin to 4 plants each. Plant only 6 to 8 seeds per hill for watermelon, and thin as needed. For more cultivation information: www.southernstates.com/articles/growing-melons.aspx

CANTALOUPE

Banana

Banana

Matures in 80 days

The long, tapered shape and color give this melon its name. Often reaching 18 inches and weighing 4 to 5 pounds, this variety has a light yellow hue and smooth texture. Flesh is a traditional orange color.

Mixed Veggies

One of the greatest rewards of gardening comes from growing vegetables that aren't always available in the average supermarket. The chart below offers some advice on making sure you have above-average success with these fun crops.

vegetable type	growing suggestions
cauliflower	Plant seeds in hot bed or flats early in spring but sow the seed sparingly and cover lightly with $\frac{1}{4}$ inch of fine soil. Transfer the cauliflower to the garden when the plants are about 5 inches high and place in rows that are $2\frac{1}{2}$ feet apart with the plants 2 feet apart. Cauliflower likes a rich soil and steady moisture and monthly feedings with a nitrogen-rich fertilizer. For the best flavor, harvest when heads are still white. To keep heads white, pull some of the larger leaves up over the heads and fasten with a rubber band or string.
eggplant	Start the seeds in hot beds, then transfer to pots to allow for stockiness before moving to the garden. The ground needs to be very warm and rich with organic matter and they need to be placed in full sun with 3 feet between each plant. Supplement with a well-balanced fertilizer once a month and keep roots cool and moist with an application of mulch when plants are 8 to 10 inches tall. Harvest while skin still has a glossy look. Once it begins to dull, it is overripe and will be spongy.
parsnips	Parsnips are a root vegetable, and soil condition definitely influences their appearance. For a better-shaped parsnip, be sure to plant in soil that is fine and loose. Thinly sow the seed in shallow rows that are no more than $\frac{3}{4}$ inch deep, and when the plants have emerged and are vigorously growing, thin them to 4 to 5 inches apart. Sow in early spring and be patient as parsnips are slow-growing. To bring out the best flavor after harvesting, store them just above freezing for several weeks.
rutabaga	Rutabagas, also known as "yellow turnips," are old-fashioned root vegetables. Sow the seed in rows that are 12 to 18 inches apart, covering with $\frac{1}{2}$ inch of soil. Once the plants are up and thriving, thin so they are spaced 4 to 6 inches apart. Rutabagas prefer cooler temperatures and if you attempt to grow them in very hot weather they become woody. As with other root vegetables, harvest while young for best flavor and texture.

Mixed Veggies

CAULIFLOWER

Snowball Y Cauliflower

Matures in 55 days

Large, strong leaves wrap up and over the medium-to-large heads of this improved early variety to help keep the heads an attractive snowy white.

Peppers

Peppers can be grown in a wide variety of situations and respond well to production in containers. Ensure that the soil has been treated with a suitable low nitrogen fertilizer (such as 5-10-10 or 10-10-10) and keep the plants well watered until established. Peppers favor a slightly acidic soil with a pH range between 5.8 and 6.5 giving the best results. For more cultivation information: www.southernstates.com/articles/growing-peppers.aspx

California Wonder

California Wonder

Matures in 74 days

Sweet and mild, this thick-walled variety is dark green, shiny and 4 to 4½ inches long. When fully mature, fruits turn scarlet red and very sweet. The strong plants are dynamic growers.

Radishes

Cool weather is essential for good quality radishes since they become pithy in hot weather. Sow seed $\frac{1}{4}$ inch deep in 12 inch or wider rows in early spring or early fall. Thin once the seedlings emerge to allow 2 to 3 inches between plants. Several small plantings can be made at weekly intervals to lengthen harvest duration. Pull radishes out of the soil in a timely manner when roots are $\frac{1}{2}$ to 1 inch in diameter. Under proper harvest conditions they will keep up to a month in the refrigerator once cleaned and trimmed. For more cultivation information: www.southernstates.com/articles/growing-radishes.aspx

Cherry Belle ①

Matures in 22 days

Noted for great taste, color, shape and texture, the uniform, round root is bright cherry red with a crunchy white interior that is mild and sweet. Short tops make this a good choice for hot beds or greenhouse forcing. An All-America Selections bronze medal winner.

Squash

By following a few simple rules, squash can make even the most indifferent gardener an unqualified success. As soon as the soil is warm, plant 8 to 10 seeds in hills of soil that are spaced 4 to 6 feet apart. Then thin the seedlings out, leaving the 3 sturdiest plants to each hill. Squash likes lots of organic matter such as aged manure or compost in its soil. For best flavor, harvest the vegetables while they are young and still shiny, and before their seeds are well-developed. A versatile vegetable, the many varieties of squash lend themselves to everything from appetizers to desserts. They are excellent sautéed or steamed and when used in casseroles, breads or cakes. They're even good raw with dips. For more cultivation information: www.southernstates.com/articles/summer-squash.aspx

49er Hybrid

Black Beauty Zucchini

Butternut

49er Hybrid

Matures in 50 days

Produces straight, golden yellow zucchini measuring 7 to 8 inches long. The plants are upright and open. It has excellent yields and flavor, and can be marketed as both baby zucchini and full size fruits. Good for both home gardens and roadside stands.

Sunflowers

Sunflowers are heat loving annuals that do well in full sun and sandy, loamy soil. They add color and height to the garden and attract bees and butterflies. Most sunflowers are easy to grow as long as the soil is not overly wet. Sunflowers thrive at pH levels of 6-7.5 and require nutrient rich soils with ample organic matter or a slow release granular fertilizer. Sow directly in the soil after all danger of frost has passed. Plant no more than 1 inch deep and about 6 inches apart in the row. Space rows 30 inches apart. For more sunflower information: www.almanac.com/plant/sunflowers

**MOST SWEET
CORNS ARE
AVAILABLE IN
50 LB. BAGS**

Plant sweet corn after all danger of frost is past in well fertilized soil. For early varieties, plant in hills with 4 to 6 kernels per hill, 3 to 4 feet apart each way. Thin to 3 or 4 plants when 6 inches high. Despite its relatively deep roots, corn may need additional water to make a quality ear during a dry summer. Very hot weather can also have a negative effect on pollination. For a continuous crop, stagger plantings a few weeks apart or choose varieties with different maturities. For more cultivation information: www.southernstates.com/articles/backyard-sweet-corn.aspx
All Sweetcorn varieties are treated.

Bilicious Hybrid

Bilicious Hybrid ①

Hickory King Corn

Hickory King Corn (Dent Corn)

Matures in 115 days

Considered the best variety for hominy because the skin of the kernel is easily removed by soaking. Also good for grits, corn meal and flour. Makes a nice roasting corn (the old fashioned way of eating corn on the cob). This variety grows extremely tall with stalks reaching 12 feet. Some people use this variety for providing support for pole beans. Produces about 2 ears per stalk. Ears have very large flat white kernels. Husks are tighter than most varieties and give excellent protection from beetles and earworm. Has good tolerance to northern leaf blights (H. turicum) and southern leaf blight (H. maydis).

¼ lb 020-30971

5 lb 020-60971

Tomatoes

For the earliest tomatoes, start seeds indoors about 4 to 6 weeks before time to set outside. After seedlings are about 2 inches high, transplant to pots or boxes. Transplant again, this time to the garden, after there is no longer a danger of frost. Place individual plants, including roots and dirt, in watered holes, leaving 3 to 4 feet between each plant. Have garden soil enriched with compost or aged manure. It's a good idea to mulch with straw while the plants are still only a few feet tall to ensure moisture retention. For best results, be sure to use a fertilizer with a high calcium content. This will help prevent blossom-end rot. All days to maturity listed below are in reference to days after transplanting. For more cultivation information: www.southernstates.com/articles/growing-tomatoes.aspx

Beefsteak Red

Beefsteak Red

Matures in 80-90 days

Beefsteaks are always grown for their flavor and size for slicing and summer sandwiches. This variety produces large, meaty red fruit over a long season on indeterminate plants. Because it matures late compared to many other tomatoes, it will provide a fresh harvest in the latter part of the season.
