DIRECT DRIVE

BELT DRIVE

DIRECT DRIVE VS. BELT DRIVE FANS

On a direct drive fan, the fan propeller is attached directly to the shaft of the motor. On belt drive fans the fan motor shaft has a pulley connected by a belt to a second pulley, which is then connected to a shaft that drives the fan propeller. Each motor type has its own advantages:
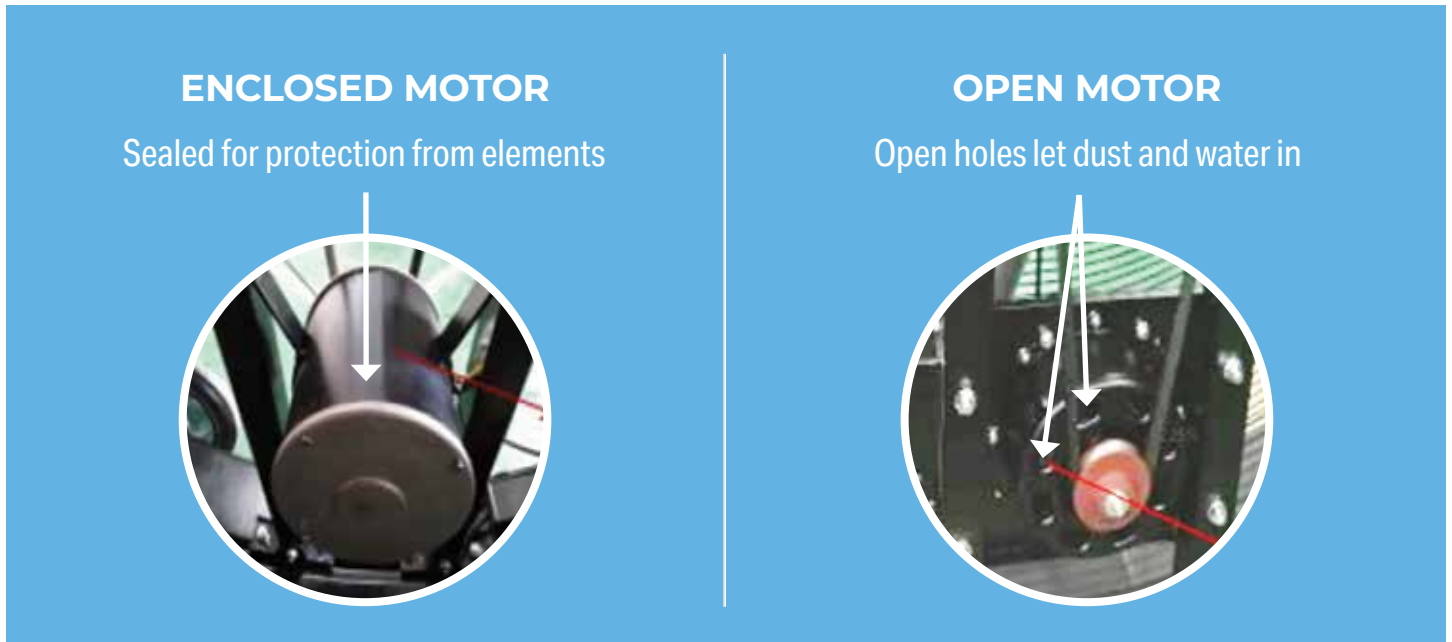

EFFICIENCY: Direct drive fans have no power loss because the propeller is directly connected to the motor shaft. Belt drive fans lose some power due to the friction between the belt and sheaves, and the drive shaft bearings.

MAINTENANCE: Direct drive fans require very little to no maintenance. Belt drive fans will require periodic maintenance over their lifespan to lubricate the drive shaft bearing, align the sheaves, and tighten the belt.

RELIABILITY: Direct drive fans can be used in most environments without failure, while the rubber belt in belt drive fans is susceptible to heat.

NOISE: The sound level of a fan is best reduced by slowing the propeller speed. The propeller speed of direct drive fans is limited to the standard motor speeds; however, the size of the sheaves in a **belt drive fan** can be adjusted for lower propeller speeds.

ENCLOSED MOTOR

Sealed for protection from elements

OPEN MOTOR

Open holes let dust and water in

ENCLOSED VS. OPEN MOTORS

Drum fans are commonly used in dusty and humid environments, such as workshops, warehouses, and barns. Open or partially enclosed motors leave the fans' internal workings exposed to this harmful environment. Enclosed motors solve this problem by fully encasing the motor to protect it from dust and humidity.
