

Hot Tub Winter Care

www.canadianspacompany.com

Before the Cold

Check your filters. Filters should be changed every 3-4 months and cleaned regularly.

Change your water. Water should be changed every 3 months.

Upon water change, flush the plumbing with whirlpool rinse. This removes build-up within your spa, ensuring its efficiency.

Keep the Heat in

Heat rises. Have a good quality cover to keep your heat in and the cold out!

A cover guard is a good option to protect your cover from ice, snow and rain.

An insulated spa jacket protects your entire spa, creates additional insulation and reduces your energy use.

Water Care

Check your water level. If the water is too low, it may cause disturbances with your pump.

Test your water regularly and make sure to keep your water chemicals balanced.

Keeping your water at a consistent temperature is more energy efficient and better for your spa.

Caution Snow & Ice

- Clear any ice and snow off of your cover and around your hot tub so you can keep your spa and yourself safe.
- Doing this will also let any potential leaks be visible and easily accessible if a technician must service it.

It's a Good Idea to:

- Keep a garden hose in the house (to avoid freezing) for quick and easy use to level your water.
- Pay attention to your drain valve. A leak could occur as the temperature change can sometimes expand and contract the parts.
- Have a space heater and submersible pump in case of emergency situations where you would need to alternatively heat your plumbing or empty your water.
