

Guide note for 18590000 using the SP HS120 Hollow Cylinder

The HS 120 hollow cylinder when used in the 18590000 injector removal kit must be used as follows to avoid damaging the threads on the main pulling spindle or the inside of the hollow cylinder itself.

Ensure that the spindle protrudes sufficiently through the cylinder to allow the reaction nut to be mounted as per image.

The nut must be then wound down tight against the top of the cylinder – as it is this nut that has to take the entire pulling load, and not the guide threads of the actual cylinder.

If this nut is not wound tightly down before the application of force then the threads on the spindle and the inside of the cylinder may become damaged.

Sykes-Pickavant will not cover such damage under warranty.
