

Active Pure Bio Benchtop

Correct Order is Key:

- Always install the Active Pure Filter before (or upstream of) the Bio Mineral Cartridge to ensure the system works correctly.

Flow Rate Matters:

- Aim to keep the water flow at or below 1.5 liters per minute for effective filtration. If you fill a cup in less than 5 seconds, the flow is too fast.

Use Cold Water Only:

- The system is designed for cold water. Using hot water could damage the filters.

Tap Lever Positions:

- The tap lever in the vertical position allows water to run into the sink. In the horizontal position, water passes through the filtration system.

Flush Before Use:

- If the Active Pure XTRA filter hasn't been used for 2 days or more, flush it for 2 minutes.
- Before installing the Bio Mineral cartridge, flush the Active Pure XTRA filter.
- Flush both filters with cool water for about 10 minutes before connecting them to an ionizer, to avoid clogging. Expect some carbon dust initially.

Following these guidelines carefully will help prevent equipment damage and health risks, ensuring your system operates efficiently.
