1 Safety

1.1 How to use this manual

This manual contains important information, guidelines, operation and maintenance for the following products: POW-SunSmart 8KL3; POW-SunSmart 10KL3; POW-SunSmart 12KL3. This manual must be followed during installation, use and maintenance.

1.2 Symbols in this manual

Symbols	Description
DANGER	DANGER indicates a hazardous situation which if not avoided will result in death or serious injury.
WARING	WARING indicates a hazardous situation which if not avoided could result in death or serious injury.
CAUTION	CAUTION indicates a hazardous situation which if not avoided could result in minor or moderate injury.
NOTICE	NOTICE provide some tips on operation of products.

1.3 Safety instruction

DANGER

- This chapter contains important safety instructions. Read and keep this manual for future reference.
- Be sure to comply the local requirements and regulation to install this inverter.
- Beware of high voltage. Please turn off the switch of each power sources before and during the installation to avoid electric shock.
- For optimal operation of this inverter, select the appropriate cable size and the necessary protective devices as specified.
- Do not connect or disconnect any connections when the inverter working.
- Do not open the terminal cover when the inverter working.
- Make sure the inverter is well grounding.
- Be careful not to cause short-circuiting of the AC output and DC input.
- Do not disassembly this unit, for all repair and maintenance, please take it to the professional service center.
- Never charge a frozen battery.

2 Production Instructions

2.1 Instructions

POW-SunSmart L3 series is a new type of solar energy storage inverter control inverter integrating solar energy storage & utility charging and energy storage, AC sine wave output. It adopts DSP control and features high response speed, reliability, and industrial standard through an advanced control algorithm.

2.2 Features

- Supports lead-acid battery and li-ion battery connections.
- With a dual activation function when the li-ion battery is dormant; either mains or photovoltaic power supply access can trigger the activation of the li-ion battery.
- Support three-phase pure sine wave output (350~415V).
- Supports phase voltage adjustment in the range of 200, 208, 220, 230, 240Vac.
- Supports two PV inputs, with the function of simultaneously tracking the maximum power charging or carrying capacity of two MPPT.
- Dual MPPT, efficiency up to 99.9%, single maximum current of 22A, perfectly adapted to highpower modules.
- 4 charging modes are available: solar only, mains priority, solar priority, and mixed mains and PV charging.
- With time-slot charging and discharging setting function, it helps users to take advantage of peak and valley tariffs and save electricity costs.
- Energy-saving mode function to reduce no-load energy losses.
- With two output modes of utility bypass and inverter output, with uninterrupted power supply function.
- LCD large screen dynamic flow diagram design, easy to understand the system data and operation status.
- 360° protection with complete short-circuit protection, over-current protection, over-voltage protection, under-voltage protection, over-load protection, etc.
- Support CAN, USB, and RS485 communication.

2.3 System connection diagram

The diagram below shows the system application scenario of this product. A complete system consists of the following components:

- 1. **PV modules:** converts light energy into DC energy, which can be used to charge the battery via an inverter or directly inverted into AC power to supply the load.
- Utility grid or generator: connected to the AC input, either of the connected utility and
 generator can charge the battery while supplying the load. When the batteries and photovoltaic
 modules supply the load, the system can operate without the utility or generator.
- 3. **Battery:** The role of the battery is to ensure the normal power supply of the system loads in case of insufficient photovoltaic and no utility power.
- Home load: connects to a variety of home and office loads including refrigerators, lamps, TVs, fans, air conditioners and other AC loads.
- 5. Inverter: it is the energy conversion device of the whole system.

The actual application scenario determines the specific system cabling.

2.4 Production overview

1	LCD screen	2	LED indicator	3	Touchable key
4	ON/OFF rocker switch	5	PV input (PV1+PV2)	6	Battery (positive)
7	Battery (negative)	8	Dry contact	9	RS485/CAN port
10	WIFI port	11	USB-B port	12	Grounding screw
13	AC output(L1+L2+L3+N)	14	AC input(L1+L2+L3+N)	15	AC input circuit breaker

3 Installation

3.1 Select the mount location

POW-SunSmart L3 series can be used outdoors (protection degree IP20). Please consider the followings before selecting the location:

- Choose the solid wall to install the inverter.
- Mount the inverter at eye level.
- Adequate cooling space must be provided for the inverter.
- The ambient temperature should be between -10~55[°]C (14~131[°]F) to ensure optimal operation.

DANGER

- Do not install the inverter near highly flammable materials.
- Do not install the inverter in a potentially explosive area.
- Do not install the inverter in a confined space with lead-acid batteries.

CAUTION

- Do not install the inverter in direct sunlight.
- Do not install or use the inverter in a humid environment.

3.2 Mount the inverter

Drill 4 mounting holes in the wall with an electric drill according to the specified dimensions, insert 2 expansion screws above and 2 M5 screws below to fix the inverter.

3.3 Remove terminal protection cover and dust screen

Using a screwdriver, remove the terminal protection cover and dust screen.

NOTICE

• When using the device in areas with poor air quality, the dust screen is easily blocked by air particles. Please disassemble and clean the dust screen periodically to avoid affecting the internal air flow rate of the inverter, which may trigger an over-temperature protection fault (19/20 fault) affecting the use of the power supply and the service life of the inverter.

4 Connection

4.1 Three-phase mode

Items	Description	
Applicable models	POW series SH3 model	
AC output phase voltage (L-N)	200~240Vac, 230Vac default	

NOTICE

- The user can change the output phase mode and output voltage through the setup menu, please read chapter 5.2 for details.
- The output voltage corresponds to item [38] of the parameter setting, and the output phase voltage can be set within the range of 200V to 240V.

4.2 Cable & circuit breaker requirement

> PV input

Models	Cable Diameter	Max. PV Input Current	Circuit Breaker Spec
POW-SunSmart 8KL3	5mm² / 10 AWG	22A	2P-25A
POW-SunSmart 10KL3	5mm² / 10 AWG	22A	2P-25A
POW-SunSmart 12KL3	5mm² / 10 AWG	22A	2P-25A

> AC input

Models	Output Mode	Max. Current	Cable Diameter	Circuit Breaker Spec
POW-SunSmart 8KL3	Three-phase	23A	6mm² / 8 AWG	4P-40A
POW-SullSillall onLS	rnree-pnase	ZSA	(L1/L2/L3/N)	4F-40A
POW-SunSmart 10KL3	Three phase	29A	7mm² / 8 AWG	4P-40A
POW-Sulisilian Tokes	Tillee-pliase	29A	(L1/L2/L3/N)	4F-40A
POW-SunSmart 12KL3	Throe phose	35A	9mm² / 6 AWG	4P-40A
POW-SullSillari 12NLS	Tillee-pliase	33A	(L1/L2/L3/N)	4F-40A

> Battery

Models	Cable Diameter	Max Current	Circuit Breaker Spec
POW-SunSmart 8KL3 34mm²/ 2 AWG		180A	2P-200A
POW-SunSmart 10KL3	42mm²/ 1 AWG	220A	2P-250A
POW-SunSmart 12KL3	50mm²/ 0 AWG	260A	2P-300A

> AC output

Models	Output Mode	Max. Current	Cable Diameter	Circuit Breaker Spec
POW-SunSmart 8KL3	Three-phase	11.6A	6mm² / 8AWG (L1/L2/L3/N)	4P-24A
POW-SunSmart 10KL3	Three-phase	14.5A	7mm² / 8AWG (L1/L2/L3/N)	4P-40A
POW-SunSmart 12KL3	Three-phase	17.4A	9mm² / 6AWG (L1/L2/L3/N)	4P-40A

The wire diameter is for reference only. If the distance between the PV array and the inverter or between the inverter and the battery is long, using a thicker wire will reduce the voltage drop and improve the performance of the system.

4.3 AC input & output connection

end of the cable.

Connect the live, neutral and ground cables in the position and order of the cables as shown in the diagram below.

DANGER

- Before connecting the AC input and output, the circuit breaker must be disconnected to avoid
 the risk of electric shock and must not be operated with electricity.
- Please check that the cable used is sufficient for the requirements, too thin, poor quality cables are a serious safety hazard.

4.4 Battery connection

Connect the positive and negative cable of the battery according to the diagram below.

DANGER

- Before connecting the battery, the circuit breaker must be disconnected to avoid the risk of electric shock and must not be operated with electricity.
- Please ensure that the positive and negative terminals of the batteries are correctly connected and not reversed, otherwise the inverter may be damaged.
- Please check that the cable used is sufficient for the requirements, too thin, poor quality cables are a serious safety hazard.

4.5 PV connection

Connect the positive and negative wires of the two strings of PV according to the diagram below.

DANGER

- Before connecting the PV, the circuit breaker must be disconnected to avoid the risk of electric shock and must not be operated with electricity.
- Make sure that the open-circuit voltage of the PV modules connected in series does not
 exceed the maximum open-circuit voltage of the inverter (the value is 800V), otherwise the
 inverter may be damaged.

4.6 Dry contact connection

Use a small screwdriver to push back the direction indicated by the arrow, and then insert the communication cable into the dry junction port. (Communication cable cross section 0.2~1.5mm²)

4.7 Grounding connection

Make sure that the earth terminal is securely connected to the grounding busbar.

NOTICE

 Grounding wire shall be not less than 4 mm² in diameter and as close as possible to the earthing point.

4.8 Final assembly

After ensuring that the wiring is reliable and the wire sequence is correct, restore the terminal protection cover to its original position.

4.9 Start-up the inverter

- Step 1: Close the circuit breaker of the battery.
- Step 2: Press the ON/OFF switch on the bottom of the inverter, the screen and the indicator light come on to indicate that the inverter is activated.
- Step 3: Sequential close of the circuit breakers for PV, AC input and AC output.
- Step 4: Start the loads one by one in order of power from small to large.

5 Operation

5.1 Operation and display panel

The operation and display panel below includes 1 LCD screen, 3 indicators, 4 touchable keys.

Touchable keys

Touchable keys	Description
	To enter/exit the setting menu
	To next selection
	To last selection
To confirm/enter the selection in setting me	

LED Indicators

LED Indicator	LED Indicator Color Description		
AC/INV	Croon	Always on: utility bypass output	
AC/INV	Green	Flash: inverter output	
OUADOE	V-II	Always on: charging complete	
CHARGE	Yellow	Flash: charging	
FAULT	Red	Flash: fault occur	

5.2 Display panel

Icon	Icon Description		Description
	Indicates the PV panel		Indicates the utility grid
	Indicates the battery	<u> </u>	Indicates the generator
NECTE:	Indicates the inverter is working		Indicates the home load
(i)	Indicates the inverter is communicating with data collector		Indicates the buzzer muted
***************************************	Indicates the direction of energy flow		
STANDBY	Indicates the inverter is standby	NORMAL.	Indicates the inverter is working normally
ALARM	Indicates error occur	₹ <u>`</u> }	Indicates setting
7	Indicates load power 80%~100%		Indicates battery SOC 80%~100%
# # # # # # # # # # # # # # # # # # #	Indicates load power 60%~79%		Indicates battery SOC 60%~79%

9	Indicates load power 40%~59%		Indicates battery SOC 40%~59%
	Indicates load power 20%~39%		Indicates battery SOC 20%~39%
	Indicates load power 5%~19%		Indicates battery SOC 5%~19%
UNDER VOLT	Indicates battery under- voltage	END OF DISCHG	Indicates battery discharge
OVER LOAD	Indicates over-load	BMS FAULT	Indicates BMS fault
СОМ	Indicates system communication error	UV	Indicates system under-voltage
OV	Indicates system over- voltage	UT	Indicates system under- temperature
ОТ	Indicates system over- temperature	OC	Indicates system over-current
FULL	Indicates battery is full	USER	Indicates user defined battery
SLD	Indicates sealed lead-acid battery	FLD	Indicates flooded lead-acid battery
GEL	Indicates gel lead-acid battery	NCM	Indicates ternary li-ion battery
LFP	Indicates LFP li-ion battery	ECO	Indicates energy-saving mode
PV LOAD	Indicates PV energy is carrying the load	PV CHG	Indicates PV energy is charging the battery
AC CHG	Indicates AC IN energy is charging the battery	MAIN FIRST	Indicates the inverter output mode is mains power first
BYPASS	Indicates the inverter output mode is bypass	SOLAR FIRST	Indicates the inverter output mode is solar first
BATT FIRST	Indicates the inverter output mode is battery first		

5.3 View real-time data

In the main screen, press the UP / DOWN keys to view the real-time data of the inverter during operation.

Page	PV side	BAT side	AC IN side	LOAD side	General

5.4 Setting

ID	Parameter Meaning	Options	Description
	Exit	ESC	Exit the setup menu.
			Utility Priority. Utility power is given
		UTI default	priority to the loads, the battery inverts
		On deladit	to provide power to the load only when
			utility power is unavailable.
			Priorities the use of PV to power the
			load and switches back to the mains to
			power the load only when the battery
			voltage is lower than the set value in
			parameter item [4] (when connected to
	AC output source priority	SBU	the BMS, according to item [61]). When
			the battery voltage is higher than the
			value set in parameter [5] (when
			connected to the BMS, according to
			item [62]), it switches back to the PV
			from the mains to supply the load.
		SOL	PV priority. Switching to mains to power
			the load when PV is not effective or
			when the battery is below the setting of
			parameter item [4].
		50.0Hz default	AC output frequency will adaptive utility
82	AC output frequency		frequency in bypass mode. Otherwise,
		60.0Hz	the output will follow the preset value.
			When parameter 01 selected SbU/SOL,
ПЦ	Voltage point of battery	43.6∀ default	output source will switch to utility from
	switch to utility	43.6V derauit	battery when the battery voltage below
			the preset value. Setting range:40~52V
	Voltage point of utility		When parameter 01 selected SbU/SOL,
85	Voltage point of utility	56.8V default	output source will switch to battery from
	switch to battery		utility when the battery voltage above

			the preset value. Range:40~60V
06	Battery charging mode	SNU default	Solar and utility charging the battery at the same time, solar at the first priority, utility power as a supplement when solar power is not sufficient. When solar power is sufficient, the utility stops charging. Note: The PV and mains can only be charged at the same time when the mains bypass output is loaded. When the inverter is operating, only PV charging can be initiated, not utility charging.
		CUB	Utility is the first priority in charging, Solar charging the battery only when utility is not available.
		cso	Solar is the first priority in charging, Utility charging the battery only when solar is not available.
		oso	Only solar charging the battery.

5.5 AC output mode

The AC output mode corresponds to the parameter operating priority mode and the utility hybrid with load function setting item, allowing the user to set manually.

Utility Priority Output 01 UTI (default)

Utility priority, switching to inverter only when utility is outaged (Priority: Utility > PV > Battery)

Solar and Utility Hybrid Output 34 MIX LOD

In UTI mode and parameter [34]=MIX LOD, when not connected to the battery or when the battery is full, the solar and the utility supply power to the load at the same time. (Priority: PV > Utility > Battery)

Solar Priority Output 01 SOL

The PV gives priority to powering the load, and when the PV meets the load, the excess power charges the battery.

When the PV energy is insufficient, the battery replenishes to power the load.

When the PV is ineffective, switches to mains power, and then finally to use battery power.

When the PV energy is insufficient, as well as when the battery falls below the parameter (battery to mains) or switching to the mains SOC setting value, switches to mains power supply to the load and charging, where the PV's energy is charged, without load. This mode maximises the use of the PV while maintaining battery power and is suitable for areas with stable grids.

(Priority: PV > Utility > Battery)

Inverter Priority Output 01 SBU

The PV will supply power to the loads on a priority basis. If the PV is insufficient or unavailable, the battery will be used as a supplement to supply power to the load. When the battery voltage touches the value of parameter [04] (Voltage point of battery switch to utility), it will switch to utility power supply to the load (without BMS connected) / When the BMS is connected and the Li-ion battery SOC touches the value of parameter [61] (Switching to utility SOC setting), it will switch to utility power supply to the load. This mode maximises the use of DC energy, and it is suitable for the areas where the power grid is stable. (Priority: PV > Battery > Utility)

5.6 Battery charging mode

The charging mode corresponds to parameter [06], which allows the user to set the charging mode manually.

Hybrid Charging SNU (default)

PV and mains power charge the battery at the same time, with PV taking priority and mains power acting as a supplement when PV is insufficient. This is the fastest charging method and is suitable for areas with insufficient power supply, providing sufficient backup power for users. (Priority: PV > Utility)

Utility Priority Charging CUb

Utility power is prioritised to charge the battery, switching to PV charging only when utility power is unavailable (Priority: Utility > PV)

Solar Priority Charging CSO

PV priority charging, whereby mains charging is only activated when the PV fails. By making full use of the PV during the day and switching to utility charging at night, the battery power can be maintained. This mode is suitable for applications in areas where the grid is relatively stable and electricity is expensive. (Priority: PV > Utility)

Only Solar Charging OSO

Only PV power is used to charge the battery, without starting the mains charging. This is the most energy-efficient method, with all battery power coming from solar energy, and is usually used in areas with good radiation conditions.

5.7 Time-slot charging/discharging function

POW-SunSmart L3 series is equipped with time-slot charging/ discharging function, users can set different charging/discharging time slots according to the local peak and valley electricity price, so as to make efficient use of utility power and PV energy. When the utility price is expensive, the battery inverter can be used to supply power to the loads. When the utility price is cheap, the utility power can be used to supply and charge the loads, which can help users save the electricity bill to the greatest extent. Users can turn on/off the time-sharing charging/discharging function in the setting menu parameters [46] and [53], and set the charging and discharging time periods in parameters [40-45], [47-52] for timed mains charging start/time setting and timed battery discharging start/time setting. Here is a case example to help users understand the function.

NOTICE

Before using this function for the first time, please set the local time in parameter items 54,
 55, then the user can set the corresponding time slot according to the local peak and valley tariff charges.

Time-slot Utility Charging/Carrying Function

With 3 definable periods, the user can freely set the mains charging/carrying time within the range of 00:00 to 23:59. During the time period set by the user, if PV energy is available, PV energy will be used first, and if PV energy is not available or insufficient, utility energy will be used as a supplement.

Time-slot Battery Disacharging Function

With 3 definable periods, the user can freely set the mains charging/carrying time within the range of 00:00 to 23:59. During the time period set by the user, if PV energy is available, PV energy will be used first, and if PV energy is not available or insufficient, utility energy will be used as a supplement.

NOTICE

• If no BMS is connected, the inverter will charge according to the battery voltage with a preset charging curve. When the inverter communicates with the BMS, it will follow the BMS instructions to perform a more complex stage charging process.

6 Communication

6.1 Overview

6.2 USB-B Port

Users can use the host computer software to read and modify the device parameters through this port. If you need the installation package of the host computer software, you can download it from the official website of SRNE or contact us to get the installation package.

6.3 WIFI port

The WIFI port is used to connect to the Wi-Fi/GPRS data acquisition module, which allows users to view the operating status and parameters of the inverter via mobile pho ne APP.

RJ45	Definition
Pin 1	5V
Pin 2	GND
Pin 3	/
Pin 4	/
Pin 5	/
Pin 6	/
Pin 7	RS485-A
Pin 8	RS485-B

6.4 RS485/CAN port

The RS485-2 port is used to connect to the BMS of Lion battery.

NOTICE

- If you need to use the inverter to communicate with the lithium battery BMS, please contact us for the communication protocol or upgrade the inverter to the appropriate software program.
- If you are using a normal RJ45 cable, check the pin definitions, pin 1 and pin 2 usually need to be cut off for proper use.

RJ45	Definition
Pin 1	5V
Pin 2	GND
Pin 3	1
Pin 4	CANH
Pin 5	CANL
Pin 6	1
Pin 7	RS485-A
Pin 8	RS485-B

6.4 Dry contact port

Dry contact port with 4 functions:

- 1. Remote switch on/off
- 2. Switching signal output

- 3. Battery temperature sampling
- 4. Generator remote start/stop

Function	Description
Remote switch	When pin 1 is connected with pin 2, the inverter will switched off the AC output. When pin1 is disconnected from pin2, the inverter outputs normally.
Switching signal output	When the voltage of battery reaches the battery discharge limiting voltage (parameter [15]), pin 3 to pin 1 voltage is 0V. When the battery charging is normal, pin 3 to pin 1 voltage is 5V.
Temperature sampling (reserved)	Pin 1 & Pin 4 can be used for battery temperature sampling compensation.
Generator remote switch	When the voltage of battery reaches the battery under-voltage alarm point (parameter [14]) or voltage point of battery switch to utility (parameter [04]), pin 6 to pin 5 normally open, pin 7 to pin 5 normally close. When the voltage of battery reaches the voltage point of utility switch to battery (parameter [05]) or battery is full, pin 6 to pin 5 normally close, pin 7 to pin 5 normally open. (Pin 5/6/7 outputs 125Vac/1A, 230Vac/1A, 30Vdc/1A)

NOTICE

• If you need to use the remote start/stop function of the generator with dry contact, ensure that the generator has ATS and supports remote start / stop.

7 Fault and Remedy

7.1 Fault code

Fault Code	Meaning	Does it Affect the outputs	Descriptions

Fault Code	Meaning	Does it Affect the outputs	Descriptions	
13	OverloadBypass	Yes	Bypass overload protection	
14	OverloadInverter	Yes	Inverter overload protection	
15	AcOverCurrHw	Yes	Inverter over-current, hardware protection	
16	AuxDSpReqOffPW M	Yes	Slave chip request switch off failure	
17	InvShort	Yes	Inverter short-circuit protection	
18	Bussoftfailed	Yes	Busbar soft start failed	
19	OverTemperMppt	No	PV heat sink over-temperature protection	
20	OverTemperInv	Yes	Inverter heat sink over-temperature protection	
21	FanFail	Yes	Fan failure	
22	EEPROM	Yes	Memory failure	
23	ModelNumErr	Yes	Wrong model	
24	Busdiff	Yes	Positive and negative busbar voltage imbalance	
25	BusShort	Yes	Busbar short circuit	
26	Rlyshort	Yes	Inverter output back flow to bypass	
28	LinePhaseErr	Yes	Utility input phase fault	
29	BusVoltLow	Yes	Busbar under-voltage protection	
30	BatCapacityLow1	Yes	Battery SOC below 10% alarm (Effective after successful BMS communication)	

Fault Code	Meaning	Does it Affect the outputs	Descriptions
31	BatCapacityLow2	No	Battery SOC below 5% alarm (Effective
J1	вакоараскусоw2	NO	after successful BMS communication)
	BatCapacityLowSto		Battery low capacity shutdown
32	p	Yes	(Effective after successful BMS
	Р		communication)
58	BMSComErr	No	BMS communication failure
10 2011 20 2011 20 200 20 200 2			BMS under-temperature alarm
60	BMSUnderTem	No	(Effective after successful BMS
			communication)
61	BMSOverTem	No	BMS over-temperature alarm (Effective
01	Bivisoverrein	NO	after successful BMS communication)
62	BMSOverCur	No	BMS over-current alarm (Effective after
02	Bivisovercui	NO	successful BMS communication)
63	BMSUnderVolt	No	BMS under-voltage alarm (Effective
	BiviSorider voit	140	after successful BMS communication)
64	BMSOverVolt	NI-	BMS over-voltage alarm (Effective after
04	Divisovervult	No	successful BMS communication)

7.2 Troubleshooting

Fault Code	Meaning	Causes	Remedy
/	No screen display	No power input, or the switch on the bottom of the unit is not switched on.	Check whether the battery air circuit- breaker or PV air circuit-breaker is turned on. Check if the switch is "ON". Press any button on the screen to exit the screen sleep mode.
01	Battery under-voltage	The battery voltage is lower than the value set in parameter [14].	Charge the battery and wait until the battery voltage is higher than the value set in parameter [14].
03	Battery not connected	The battery is not connected, or the BMS is in discharge protection state.	Check that the battery is reliably connected. Check that the battery circuit- breaker is off. Ensure that the BMS is able to communicate properly.
04	Battery over- discharge	The battery voltage is lower than the value set in parameter [12].	Manual reset: Switch off and restart. Automatic reset: Charge the battery so that the battery voltage is higher than the value set in parameter item [35].
06	Battery over-voltage when charging	Battery is in over- voltage condition.	Manually power off and restart. Check to see if the battery voltage exceeds the limit. If it exceeds, the battery needs to be discharged until the voltage is below the battery overvoltage recovery point.
13	Bypass over-load (software detection)	Bypass output power or output current over- load for a period of time.	Reduce the load power and restart the device. Please refer to item 11 of the protection function for more details.

Fault Code	Meaning	Causes	Remedy
14	Inverter over-load (software detection)	Inverter output power or output current over- load for a period of time.	
19	Heat sink of PV input over-temperature (software detection)	Heat sink of PV input temperature exceeds 90°C for 3s.	Normal charging and discharging is
20	Heat sink of inverter output over- temperature (software detection)	Heat sink of inverter output temperature exceeds 90°C for 3s.	resumed when the temperature of the heat sink cools below the over-temperature recovery temperature.
21	Fan failure	Hardware detects fan failure.	Manually toggle the fan after powering off the machine to check for foreign matter blockage.
26	AC input relay short- circuit	Relay for AC input sticking.	Manually turn off and restart the machine, if the fault reappears after restarting, you need to contact the after-sales service to repair the machine.
28	Utility input phase fault	AC input phase does not match AC output phase.	Make sure that the phase of the AC input is the same as the phase of the AC output. For example, if the output is in split-phase mode, the input must also be in split-phase mode.

NOTICE

 If you encounter product faults that cannot be solved by the methods in the above table, please contact our after-sales service department for technical support and do not disassemble the equipment by yourself.

8 Protection and Maintenance

8.1 Protection function

No	Protection functions	Description
	PV input current /	When the charging current or power of the PV array configured
1	power limiting	exceeds the PV input rated value, the inverter will limit the input
	protection	power and charge at the rated.
		If the PV voltage exceeds the maximum value allowed by the
2	PV input over-voltage	hardware, the machine reports a fault and stops PV boosting to
		output a sinusoidal AC waveform.
	Anti rovorno oborno	At night, the battery will be prevented from discharging to the
3	Anti-reverse charge	PV module because the battery voltage is greater than the PV
	protection at night	module voltage.
	AC input quar valtage	When the mains voltage of per phase exceeds 280Vac, the
4	AC input over-voltage	mains charging will be stopped and will switch to inverter
	protection	output.
	AC input under	When the mains voltage of per phase falls below 170Vac, the
5	AC input under- voltage protection	mains charging will be stopped and will switch to inverter
		output.
		When the battery voltage reaches the over-voltage
6	Battery over-voltage	disconnection voltage point, it will automatically stop the PV and
b	protection	mains charging of the battery to prevent over-charging and
		damage to the battery.
	Potton, under voltage	When the battery voltage reaches the low-voltage disconnection
7	Battery under-voltage protection	voltage point, it will automatically stop discharging the battery to
	protection	prevent the battery from being over-discharged and damaged.
	Pottony over ourrest	When the battery current exceeds the range allowed by
8	Battery over-current	hardware, the machine will turn off output and stop discharging
	protection	the battery.

No	Protection functions	Description	
9	AC output short-circuit protection	When a short-circuit fault occurs at the load, the AC output voltage will be switched off immediately and output again after 1 min. If the output load is still short-circuited after 3 attempts, short-circuit fault of the load must be eliminated first and then manually re-powered in order to restore the normal output.	
10	Heat sink over- temperature protection	When the internal temperature of the inverter is too high, the inverter will stop charging and discharging; when the temperature returns to normal, the inverter will resume charging and discharging.	
11	Inverter over-load protection	After triggering the overload protection, the inverter will resume output after 3 minutes, 5 consecutive overloads will switch off the output until the inverter restarts. $ (102\% < load < 110\%) \pm 10\%: error, output switched off after 5 minutes. \\ (110\% < load < 125\%) \pm 10\%: error reported and output switched off after 10s. \\ (>125\% load \pm 10\%): error reported and output switched off after 5s. $	
12	AC output reverse	Prevents backfeeding of battery inverter AC to bypass AC inputs.	
13	Bypass over-current protection	Built-in AC input overcurrent protection circuit breaker.	
14	Bypass phase inconsistency protection	When the phase of the two bypass inputs is different from the phase of the inverter phase split, the machine will prohibit cutting into the bypass to prevent the load from dropping out o short-circuiting when cutting into the bypass.	

8.2 Maintenance

To maintain optimum long-lasting working performance, it is recommended that the following items be checked twice a year.

- 1. Ensure that the airflow around the inverter is not blocked and remove any dirt or debris from the radiator
- Check that all exposed conductors are not damaged by sunlight, friction with other surrounding objects, dry rot, insect or rodent damage, etc. The conductors need to be repaired or replaced if necessary.
- Verify that the indications and displays are consistent with the operation of the equipment, note any faults or incorrect displays and take corrective action if necessary.
- Check all terminals for signs of corrosion, insulation damage, high temperatures or burning/discolouration and tighten terminal screws.
- 5. Check for dirt, nesting insects and corrosion, clean as required, clean insect screens regularly.
- If the lightning arrester has failed, replace the failed arrester in time to prevent lightning damage to the inverter or other equipment of the user.

DANGER

Make sure that the inverter is disconnected from all power sources and that the capacitors
are fully discharged before carrying out any checks or operations to avoid the risk of electric
shock

The Company shall not be liable for damage caused by:

- 1. Damage caused by improper use or use in a wrong location.
- 2. PV modules with an open-circuit voltage exceeding the maximum permissible voltage.
- Damage caused by the operating temperature exceeding the restricted operating temperature range.
- 4. Dismantling and repair of the inverter by unauthorised persons.
- 5. Damage caused by force majeure: damage during transport or handling of the inverter.
