

WEST BEND DYNO TUNING

Assumption of Risks and Assessment of Expectations

Constructing or modifying automobiles involves certain risks. Before you begin a project, it is imperative that you understand these potential risks and be willing to accept full responsibility for them. It is extremely important that your expectations of the process are based in the reality of the complexities of this type of project. You must be prepared for time delays and additional costs associated with these projects.

Below are examples of the types of risks involved but it is by no means all inclusive.

1. There is no way whatsoever to be sure that the parts you selected will actually work together.
There are virtually limitless combinations of components and there is no way for anyone to be sure before actual assembly that all products are compatible. Additionally, just because that combination worked before is no guarantee they will work again.
Manufacturers make changes to a part during its life cycle that can cause problems with function and fitment with other manufacturers components that did not previously exist.
2. Resolving fitment, function and compatibility issues can be extremely time consuming. Any additional labor hours, shipping, replacement parts, and miscellaneous expenses will be the sole responsibility of the customer. It is unrealistic to expect the Builder to absorb the costs associated with resolving problems related to the components chosen.
3. Problem resolution can be very challenging. Patience is required. Threats and demands will not be allowed. You must be prepared for delays, additional expenses and other challenges.
4. Be prepared that by the time your project is completed every component installed will be out of warranty. That is the nature of the automotive market. Very short or non-existent warranty periods from the manufacturer virtually guaranty this will happen as the build times are longer than the warranty periods.
5. If you are prepared for these challenges and problem resolution, constructing and modifying automobiles can be a very rewarding and satisfying experience.

I assume all risks associated with building or modifying automobiles and I am prepared for the challenges,
