

Sentinel Trap Bracket with Tree Mount V2

Fix using large staples. This will allow the bottom of the trap to swing away from the tree, avoiding any leverage the animal may have to back out of the trap.

Spring loaded arms tension the lower rung against the formed bottom catch. Hooked ends shaped to hold spring in place and prevent the trap sliding left/right.

Fitting Trap to the Bracket

1. Hang the trap on the spring loaded arms and pull down to pop into place

Formed catch holds lower rung, stopping slipping, and fixing the trap firmly in place.

2. Pull trap down firmly until lower rung fits behind formed catch. Tension in spring loaded arms holds lower rung in place.
