

Single Application Racking Solutions

Components consist of isoRAC® Accessory, Portable Control Box, Operation Remote and two (2) connection cables.

Seen above connected to Siemens 81000 (non Arc-Resistant). Available for GE Limit IC7160. Additional designs under development.

## Protect What's Important.

Remote Racking is the most effective and immediate way to eliminate the risk of Arc Flash for your employees, by allowing them to perform operations from outside of the Arc Flash Boundary. But shouldn't you also protect your valuable equipment as well?

The isoRAC® Single Application Racking Device can do both, as well as become a lasting component of your Safety Program. This user-friendly, lightweight device is easy to install, operate and remove and requires no switchgear modifications be made.

The unit monitors applied torque and revolution count during the operation process, and limits torque to protect against switchgear damage. The Operation Remote displays an indication light when in use.
