

3D Ground Scan

The 3D ground scan system in the GRT device uses the latest technology to send and receive signals in the device direction and using a 3D analyzer is able to draw a 3D diagram of possible objects in the underground.

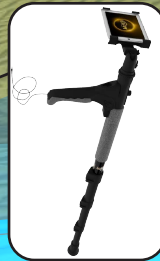

Discrimination

This system determines whether the burial is valuable or worthless by sending and receiving pulses through the device sensor and analyzing the received pulses. It is recommended to use this system when excavating the burial through a 3D scanning system and to ensure the value of the burial before excavation.

Great detectors

We offer the world's first device with the latest technology in the world of gold, metal and void detectors, which works with four search systems to detect gold and buried treasures. We communicate with our agents and customers in all countries of the world and provide them with the best services, advice and assistance

About Us

We are the exclusive agents of Great Detectors in the world

We started our work since 2012 in selling hardware products specialized in searching for minerals, gold and groundwater, so we became one of the first in marketing and selling the best devices in the world. This experience is the result of our love to be the best and highest professional we work with. The Turkish industry is proud of its superiority and exports it to be the best technology for detecting gold, minerals and voids.

OUR TARGET

We are not the only ones and we are distinguished in our equipment and work, we are Great Detector Company, we operate through direct sales and agents located all over the world, we sell all original Great Detectors products and we are the only and exclusive agents in the world for these products, our company is headquartered in Turkey in Istanbul, you can contact With us through the information available at the bottom of the web or through the web page to contact us.
