

1 1/8" Custom Cap Template

Well, there it is. Doesn't look like much does it?

This is where you come in. You can design pretty much anything your brain can dream up, we would to share a few tips to make sure your creation lasers just like you want it to:

1. Lasers only see in black and white. Make sure your artwork is bold and simple. The black areas of your design will laser white. White (or clear) areas of your design will show your chosen anodization color of your cap.
If you would like to replicate shades of gray, you need to use halftones, dither patterns etc. If you don't know what these are, keep it black and white.
2. You can use any typefaces (fonts) you like. Make sure you convert them to outlines before you send us your creation. This way, if we don't have your font that you used, your design will still look great as you intended.
3. You can use bitmap, hand drawn and scanned images in your design. Please make sure they are high resolution (600 dpi) and only simple black and white.
4. Your cool design can reach all the way to the edge of the cap and even bleed off the edge of the cap, but please make sure important info is kept away from the very edge.
5. Remember, the smaller inner circle represents the bolt hole of the cap. Any art in there will not show in your final cap. It will fall through the hole!
6. Artwork that is not on one of our template files is unfortunately not acceptable.
