

# INSTRUCTION MANUAL

## DOG TRAINER™ MODEL #300-DT

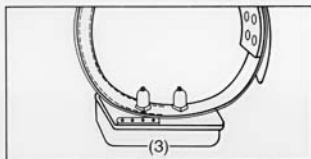

**D.T. SYSTEMS, INC.**

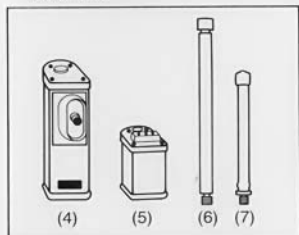

## • CONTENTS IN DOG-RADARTRON™ #300 DT

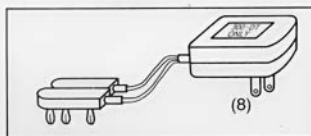

- (1) Active collar unit.  
(2) Replaceable battery pack on active collar unit.

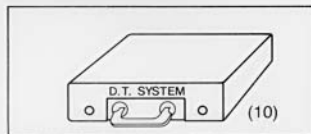

- (3) Dummy collar.

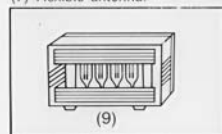

- (4) Transmitter unit.  
(5) Replaceable battery pack on transmitter unit.  
(6) Booster antenna.  
(7) Flexible antenna.

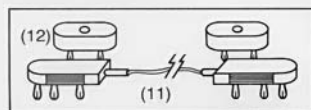

- (8) Battery charger.

- (10) Carrying case.

- (9) Test light.

- (11) Activation module.  
(12) Intensity module (Red and Yellow dot)

## • PROFESSIONAL FEATURES

- 500 Different codes.
- Transmitter unit controlled "safety off" system.
- Simple operation and ready to use.
- Water proof active collar unit.
- Rechargeable battery cell.
- Flexible antenna and booster antenna for long range.
- Comfortable handle and Guard on transmitter unit.
- Replaceable battery packs on active collar unit and transmitter unit.
- Six different levels of intensity with two modules.
- Rugged construction.
- Instant response.
- Longer range device available at factory.

## • CORRECT UNSAFE AND UNDESIRED BEHAVIOR

\* Barking \* Digging \* Chasing cars \* Chasing unwanted animals \* Chewing furniture, shoe, etc. \* Attacking

## • TEACH GOOD HABITS

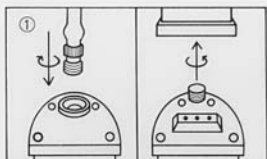

\* Obedience \* Self-confidence \* Hunting

## • TRAINING IS CARING

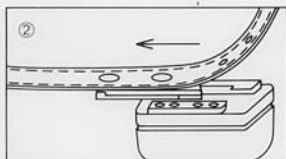

Training is for the animal's welfare. Consistent and humane punishment teaches the animal what is safe and not safe to do. Discomfort brought about by undesired behavior is a natural process of learning. Stimulation causes discomfort without physical harm. The discomfort is consistent and safe. The method of training motivates positive, desired behavior.

## • TESTING UNITS

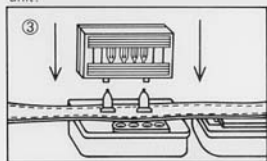

UNIT CAN BE TESTED WITHOUT PUTTING IT ON DOG.

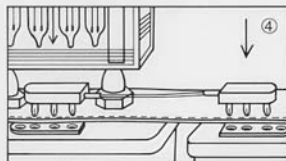

Screw in the flexible antenna and replaceable battery pack on transmitter unit.

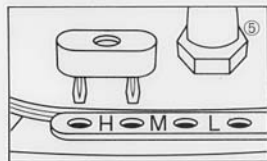

Slide in the replaceable battery pack on active collar unit.

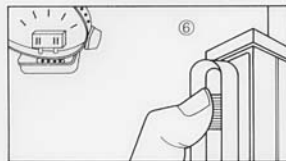

Insert the test light on inside of active collar.

Plug in the activation module.

Plug in the intensity module (Red or Yellow Dot)

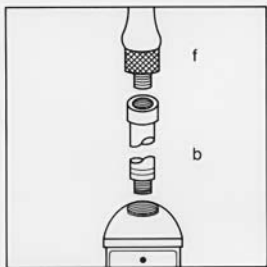

Press the button on transmitter unit.

If test light comes on, unit works properly.

The higher the intensity level chosen, the brighter the light. To check for distance, walk away from the active collar unit, stopping occasionally to push the button on the transmitter unit to see if the test light still comes on.

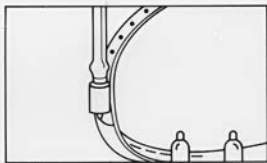

If you desire long range operation, install the booster antenna on the transmitter unit. Long or thick haired dogs, may need to have their neck brushed to remove excess or matted hair or shave where the electrodes contact the skin. The two electrodes must contact the skin at the same time or the unit will not work even if the test light works.

**Note:** If you wish to have more range, your Dog Radartron™ #300DT can be modified. Please contact your dealer or D.T. Systems, Inc.

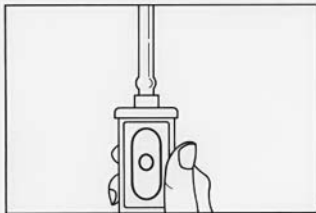

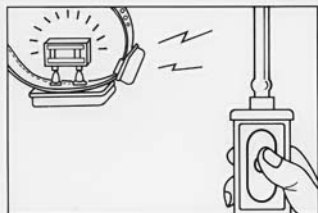

(f) Flexible antenna

(b) Booster antenna connect (f) and (b), and then screw (b) into transmitter unit for long range.

Modified active collar unit for more range.  
Contact D.T. System, Inc.

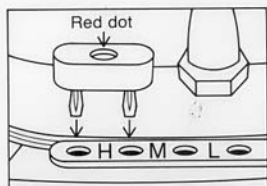

## • SAFETY OFF

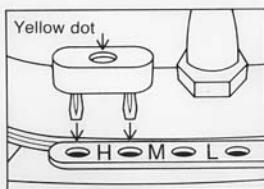

To test "safety off" feature, constantly depress the button on transmitter unit, then test light will come on for six to eight seconds and automatically turn off.

\* To reset, the unit release transmitter button for two to four second, then unit is now ready for normal use.

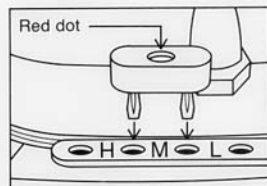

## • SIX DIFFERENT INTENSITY LEVELS

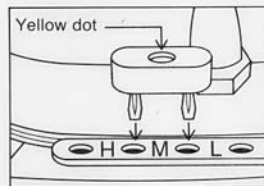

#6 INTENSITY

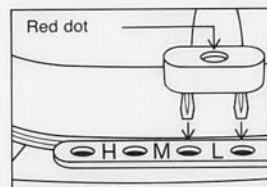

#3 INTENSITY

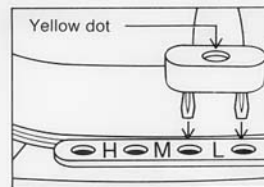

#5 INTENSITY

#2 INTENSITY

#4 INTENSITY

#1 INTENSITY

\* Level #1 is the lowest intensity and level #6 is the highest intensity.

Two interchangeable modules allow you to select six different levels of intensity according to specific needs, sensitivity of dog, and stages of training. **When training program begins, it is advised, start with the lowest intensity level.** Built-in thumb guard helps prevent unnecessary stimulation.

## • DUMMY COLLAR UNIT

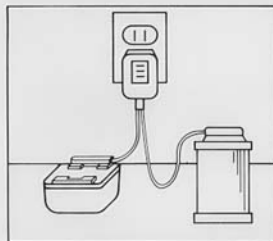

Your dog should become accustomed to the training collar before training starts. We recommend that you put on a dummy collar unit a few days before starting training program.

## • MAXIMUM WAVE RANGE

Maximum range will be achieved when transmitter unit is held straight upward toward the sky.

## • RECHARGING BATTERIES

Ordinary household voltage (115V) is required to recharge nickel cadmium batteries of transmitter unit and active collar unit. They should be charged at room temperature to insure the maximum charge.

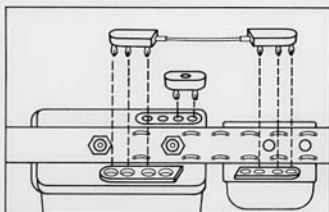

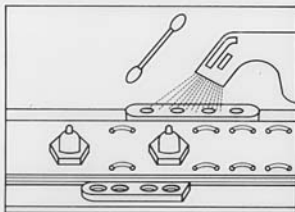

Both unit batteries may be charged simultaneously, but not necessary.

Battery in the transmitter unit does not require charging more than once or twice a week. Battery in active collar unit, with heavy usage, should be charged daily.

It might cause serious damage to battery cell, if the charger is left plugged into the battery unit over 96 hours. For long-term storage, it is necessary to charge both units for at least fourteen hours once every two months and to store them at room temperature.

Batteries of both units have been partially charged prior to shipment. However, it is necessary to recharge about 15-20 hours before initial use.

## • MAINTENANCE

It is very important to periodically wash the active collar unit with clean water. Unplug activation module when not in use. Leaving the activation module plugged in will drain the battery in the same way a flash light would go dead if left on. If the battery is completely discharged, the battery charge may not restore it to full strength.

Since no electronic device is perfect, it has always possibility that dog may receive unintentional electric stimulation (possibilities are extremely low) regardless of thoughtfull quality control of the products. Therefore you are advised only use in supervised environment.

Active collar unit is water-proofed but not transmitter unit. Getting transmitter unit wet, moisture will damage the electronics and void the warranty.

## • WARNING

Sometimes normal wear of the collar will cause an irritation on a dog's neck. For this reason the dog's neck should be rested for at least half of the 24 hour-day period by removing the collar. Close inspection of the dog's neck should be made daily. If dog shows signs of irritation, collar should be removed until neck is normal. By repeating friction of electrodes on the skin.
