

STATEMENT OF CONFIRMITY ON VERSAPAK RECYCLED SEALS

Versapak International Ltd confirm that all locking mechanism security seals are manufactured using recycled material.

Versapak Security Seals manufacturing Process

Reprocessed, Raw Materials

Versapak locking mechanism Security Seals are made from reclaimed, recycled material, also known as reprocessed material. Reprocessed material is reclaimed from manufacturers or scrap, melted down and reprocessed as a granule. Each batch that we buy in is tracked.

Regrind

We grind used Security Seals that have been sent back to us via our free Recycle Your Seals scheme with scrap leftover from our moulding process. We have the tools and facilities to do this inhouse which we mix directly with our material using our dosing unit. Our state-of-the-art granulator, used to create our regrind, has built in metal detection that detects any impurities or contamination.
