

Locking Mechanism Security Seals

Security Seals are used to provide an indication of tampering and act as a deterrent against unauthorised access. Versapak's Locking Mechanism Security Seals work with our tamper evident pouches and carriers by closing the zip, placing the zip puller in position, and inserting the seal into the locking mechanism. When the zipper is lifted the seal breaks which means that you can see immediately that someone has accessed the contents. We offer a range of different seals in a variety of colours.
