

TERRARIUM BUILD GUIDE

Drainage: Start by adding a layer of drainage at the bottom of your container. This layer will help to prevent water from accumulating around the roots of your plants.

Activated Charcoal: Add a thin layer of activated charcoal on top of the drainage layer. The charcoal helps to filter the water and keep the terrarium fresh by preventing mold and odors.

Mesh: Place a piece of fine mesh over the charcoal. This barrier will keep the substrate from mixing with the drainage layer while still allowing water to pass through.

Substrate: Add a layer of substrate on top of the mesh. The depth of the soil layer should be enough to accommodate the roots of the plants you plan to use.

Decorations: Arrange any decorative items you want to include, such as rocks, figurines, or small pieces of wood. Place these items thoughtfully to create an appealing landscape inside your terrarium.

Moss and Plants: Finally, add your plants and moss. Start with the larger plants first, followed by smaller plants and moss to fill in the gaps. Ensure each plant has enough space for its roots, and gently press the soil around them to secure them in place.

By following these steps, you will create a beautiful and functional terrarium that can thrive with minimal maintenance.
