

EquilinBASIC is a 7 in 1 formula

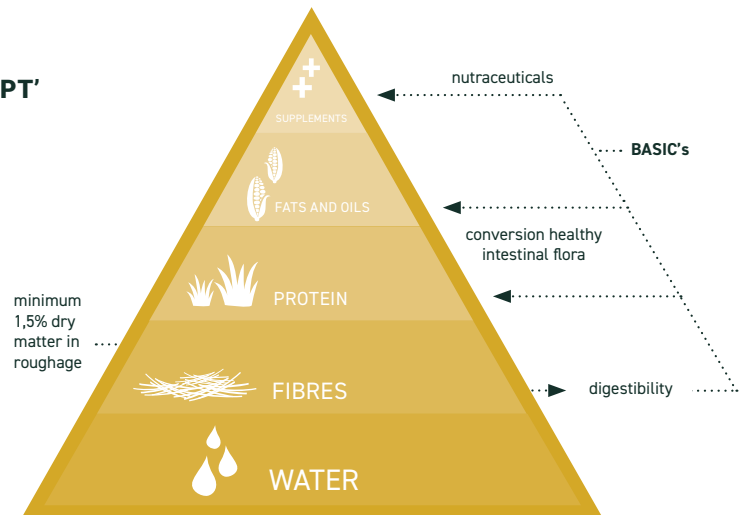

BASIC IS THE FOUNDATION OF THE 'NEW FEEDING CONCEPT'

BASIC ensures proper intestinal function and healthy intestinal flora. It improves overall health and relaxation, and makes for a horse that is willing to work.

The main ingredients are: magnesium, vitamin E without selenium, MSM, plant-based omega 3 fatty acids (DHA and EPA), essential amino acids, pre- and probiotics and a mycotoxin binding agent.

This combination of ingredients makes BASIC a unique product. All ingredients are not present in normal roughage and concentrates in high enough levels or not at all; the so-called nutraceuticals.

BASIC's unique 7 in 1 formula is cost- and time saving as most supplements become obsolete*. The horse will digest and absorb their feed better, so concentrates can be reduced or even left out altogether.

Equilin® nutritional pyramid. ©

- BASIC was made as a daily feed for your horse.
- BASIC does not contain a complete vitamin and mineral complex, so that it can be fed alongside any diet; but if no concentrates are given we do recommend to feed a **BALANCER**.
- From 2,5 years of age

***OBSOLETE SUPPLEMENTS IN ADDITION TO BASIC**

- Linseed oil or other Omega 3 oils
- Magnesium
- Vitamin E in healthy horses
- Muscle support supplements
- B vitamins and biotin, made by healthy intestinal flora

SUPPLEMENTS THAT MIGHT BE USEFUL

- A treatment of **IMMUNO** in the spring and autumn
- **GLUCO** or other joint support products
- **RECOVER** and salts
- Any specific supplements recommended by your veterinarian based on a diagnosed condition.

Many (herbal) supplements put extra strain on the liver, and the liver is crucially important for the proper digestion of the whole diet. 'It doesn't hurt to try' is hardly ever the case! Therefore, always consult an expert before use.

EquilinBASIC

DOSAGE AND INGREDIENTS

DOSAGE	Build-up*	Maintenance Recreation, combined with BALANCER	Maintenance Sport / indication with 60-100% BALANCER
Horse	350 - 450 g	120 - 180 g	180 - 250 g
Pony	150 - 350 g	65 - 100 g	100 - 225 g

* Build-up dose during 3 weeks. In times of increased stress or heavy work, the daily dose can temporarily be increased to the build-up dose for a few days.

Store in a cool and dry place.

400 g and 6,3 kg | Bulk deal 3x 6,3 kg at a 10% discount

CONTAINS AMONG OTHERS:

Contents: Apple pulp, gelatinized rice, linseed expeller, linseed fiber, alfalfa, carob flour, apple molasses, sunflower oil, lecithin

Analytical components/kg: EWpa 0,58, raw protine 13,5 %, raw fat 6,7 %, raw cellulose 13,7 %, raw ash 12,3 %, calcium 8,7 g, fosfor 2,9 g, sodium 1,2 g, magnesium 17,6 g, sugar 7,2%

Trace elements: 3b610 zinc (Zn chelate of hydroxy analogue of methionine) 216 mg, 3b510 manganese (Mn chelate of hydroxy analogue of methionine) 272 mg, (B)Added /kg

Antioxidants: 1b306(ii) strong tocopherol containing extracts of natural origin 16 mg

Binders Bentonite montmorillonite (1m558i) 12.8 g, E562 sepiolite 2.3 g, ((B)

Vitamins: 3a300 Vitamin(e) C 4200 mg, 3a700 (RRR-alpha tocopherol) Vitamin(e) E 2850 mg, DHA (Omega 3) 5000 mg,

Gut flora stabilators: 4b1702 Saccharomyces cerevisiae Sc47 230000 MCFU/kg

BASIC is doping free under FEI regulations

SIDE EFFECTS

- None known. Individual hypersensitivity to a specific ingredient could however always occur. Horses with kidney failure could experience problems with high blood values of magnesium, but generally the horse has to be really ill for this to occur. Consult your veterinarian before use.
- Avoid oral co-administration of Macrolides (certain antibiotics), as they will attach to the mycotoxin binding agents, which will make the antibiotic less effective.
- Caution, this antibiotic is only given as a third-choice for foals with a diagnosed bacteria.

BASIC should be fed for a minimum of 6 weeks (2 bags for a normal horse) before the full results become visible and noticeable. After this, the horse will still continue to improve.

In the majority of all horses and ponies that are fed BASIC's, one or more of the following improvements can be seen within 3 to 5 weeks:

- A very nice sheen and intense coat colour
- Improved endurance
- Increased recovery after work (less stiff the day after training)
- Lower heart rate both in rest and during work
- Better musculature, topline and suppler movements

- Lower muscle tone overall, more relaxation
- Improved faecal structure
- Slimmer in the flanks, less bloated
- Calmer, less anxious and more stable in behaviour
- Better hoof quality

Should a horse respond insufficiently to the BASIC's after the first six weeks, please feel free to contact us or your veterinarian, so we can advise you about possible underlying causes.
