**MICROBIOLOGY - Bacteria**

## **Across**

---

2. Bacterial organism lacking a cell wall.
4. Exotoxin released by O157 H7 E. coli.
5. Type of fever associated with rose colored spots on the abdomen.
7. Type of endotoxin found in Clostridium perfringens food poisoning.
8. E. coli causes dysuria, increased frequency of urination and this symptom.
10. Organism classified as a microaerophilic organism.
12. Clostridium spp. which causes vomiting, double vision and difficulty swallowing in an infant.
13. Bacillus contracted by eating reheated contaminated fried rice.
18. Type of fever characterized by erythema marginatum.
19. Type of workers with exposure to Brucella abortus.
20. Gas producing Clostridium.
22. Chlamydia spp causing lung infection.
23. Type of intracellular parasite which causes lymphogranuloma venereum.
25. Type of Hemophilus which causes painful genital ulcers.
26. Vector used in the spread of Rickettsia quintana.
27. Q fever is caused by this Coxiella spp.
28. Organism associated with rabbit skinning.

## **Down**

---

1. Organism most commonly associated with food poisoning.
3. Botulinum blocks this release from the neuromuscular junction.
4. Focus of endotoxins.
6. Effect of heat on endotoxins.
9. Type of fever associated with Borrelia infection.
11. Toxin derived from dead gram negative bacilli.
13. Test used to distinguish Streptococci from Staphylococci and shared by Escherichia coli.
14. Type of bacteria that prefers to live in a temperature between 20C and 45C.
15. Gram negative bacillus causing malignant pustule.
16. Occupation associated with Vibrio vulnificus infection.
17. Micro-organism best visualized by darkfield microscopy and causes jaundice.
21. Type of dysentery caused by Shigella organisms.
24. Gram positive bacilli associated with unpasteurized milk and cheese.
