

VERY IMPORTANT, READ BEFORE USING YOUR MAXIMIST EVO TNT

Your MaxiMist Evo TNT Turbine features a variable speed rheostat that controls the output of the turbine motor.

When using your MaxiMist Evo TNT Turbine it is only necessary to adjust the turbine to 30% power. This "sweet spot" setting will give you a soft even application and quiet operation.

There is no need to ever run your machine at more than 30% power.

Running your unit at the suggested settings will insure years and years of reliable service.

Failure to run at the suggested settings may cause overheating and the built in thermal protection will cause the unit to shut off for about 15 minutes until it resets.

The thermal protection will also shut down the unit when it senses clogged or dirty air filters.

This is built in fail safe to protect your equipment.
