

Things to check before you start:

- Make sure your router is configured to 2.4G, and your smartphone is connected to the same WiFi network
- Make sure the electronic device shown on your iOS/Android INPLUG app is the one plugged into the INPLUG socket.
- Make sure you have a strong Wi-Fi signal at the INPLUG socket.
- The sync operations of INPLUG socket are only possible via a Wi-Fi network connected to the internet.
- INPLUG socket needs to be setup again when the SSID or password is changed.
- No need to setup the INPLUG socket again when you turn it off or unplug it from one wall socket and plug it into another wall socket.
- INPLUG sockets will appear on all iOS/Android devices with the INPLUG app installed and in the same Wi-Fi network.
- The clock of INPLUG socket is synchronized to the cloud server, not your local iOS/Android device. So 1-2 minutes delay is perfectly normal on timer settings.
- INPLUG socket has to be synchronized again after the firmware is updated (automatically or manually).
