

# Guided Bone Regeneration Membrane Exposure 2-weeks Post-op using StellaLife Rinse

## Description

Patient presented for a 2-week postoperative check after lateral ridge augmentation at site #19. The patient had a large membrane exposure with soft tissue dehiscence.

## Method

Advised patient that we will mostly likely lose the graft, placed patient on StellaLife Rinse alone three times daily. The patient was seen 2 weeks later for a follow-up and complete closure of the membrane exposure occurred.

## Conclusion

2 weeks of the StellaLife VEGA Rinse accelerated wound healing and closure was achieved after a large membrane exposure.  
"I was so impressed with the wound healing observed utilizing the StellaLife rinse alone. The patient and I were both relieved that she didn't lose the graft and was able to proceed with implant placement. An otherwise unfortunate complication was managed with StellaLife."
