

Sealed Lead-Acid Battery INSTRUCTIONS FOR BATTERY INSTALLATION

1. Check battery open circuit voltage.
2. When voltage is lower than 12 volt or storing time is longer than 6 months, the battery must be recharged as described in item 4.
3. When voltage is higher than 12 volt, the battery may be installed on the vehicle without any refreshing charge.
4. Constant voltage charging mode:
 - Constant voltage range = 14.40-14.70V
 - Initial charging current = 0.1-0.5 Cn
 - Charging time = 6 minutes/24 hours max.

Constant current or power charging time:

- Max. charging current = 0.1 Cn
- Recommended charging time = 5-8 hours

The result [(charging current) x (charging time)] must be within the range 0.5-0.8 Cn.

N.B.: When charging procedures different from those described are used, in any case, maximum currents and charging duration (24 hours) must not be exceeded.
