

Fola Max

Fola Max is an orally administered medical food for use only under the supervision of a physician for the metabolic management of low 5-methyltetrahydrofolic acid (5-MTHF) levels associated with depression.*

Discussion

Fola Max provides a proprietary biologically active folate, 5-MTHF glucosamine salt, also known as Quatrefolic®. Research suggests that the involvement of folate (specifically 5-MTHF) in neurotransmitter synthesis is primarily responsible for its effects on mood and cognition. Folate, in the form of 5-MTHF, bypasses the need for folate to be converted to its active form and overcomes the challenge of improving folate status in individuals with certain genetic polymorphisms.^[1]

5-MTHF is the active, circulating form of folate and the main form found naturally in food. Unlike supplementary folic acid, which requires enzymatic conversion to become biologically active, 5-MTHF is able to penetrate cellular membranes without being metabolized.

MTHFR Polymorphism

Methylenetetrahydrofolate reductase (MTHFR) is an enzyme necessary for the conversion of folate to 5-MTHF. There is a significant association between MTHFR polymorphism and depression risk.^[2] 5-MTHF plays a key role in the manufacture of S-adenosylmethionine (SAMe); methylation of DNA, proteins, neurotransmitters, and phospholipids; and remethylation of homocysteine to methionine.^[1,3,4] Nutrigenomic research indicates that some individuals, due to their unique genetic patterns and expression, do not produce adequate or effective MTHFR.^[1,5]

Research has shown racemic 5-MTHF to be seven times more bioavailable than folic acid.^[6] In other research, 5-MTHF was more effective than folic acid at increasing total plasma folate concentrations in subjects with the TT and CC genotype of the 677C→T mutation of MTHFR.^[7]

Quatrefolic

Quatrefolic is a new dietary ingredient (NDI) that shows enhanced stability and bioavailability when compared to the calcium salt form of 5-MTHF. In a direct comparison between Quatrefolic, (6S)-5-methyltetrahydrofolate calcium salt, and folic acid in rats, Quatrefolic demonstrated a much higher absorption rate within the first two hours (1918.8, 1061.9, and 614.0 nmol/l plasma, respectively).^[8] In a single-dose, balanced, two-sequence, two-period, two-treatment, randomized, crossover human study, Quatrefolic showed better bioavailability (+10%) than (6S)-5-MTHF calcium salt (Ca-L-5-MTHF).^[9]

5-MTHF and Depression

According to some researchers, depression is very common. In fact, it is estimated that one-fourth of the US population will have a depressive episode sometime in their lives.^[1] 5-MTHF is involved in the metabolic management of low 5-MTHF levels associated with depression by supporting the body's ability to regulate the biosynthesis of brain neurotransmitters, such as serotonin, norepinephrine, and dopamine.^[1,10] For instance, 5-MTHF participates in the remethylation of homocysteine to create methionine. Furthermore, SAMe is the downstream metabolite of methionine, but it needs 5-MTHF to be manufactured. SAMe is believed to be involved in numerous biochemical methyl donation reactions, including reactions forming monoamine neurotransmitters.^[1] Researchers believe that inadequate 5-MTHF, as a consequence of folate deficiency or from the inability to sufficiently convert folic acid to 5-MTHF, impacts the complex balance of brain neurotransmitters.^[1,11,12] Supplementation with oral 5-MTHF has proven beneficial in depressive disorders.^[11,13]

Adjunctive Use of 5-MTHF in Major Depressive Disorder

Fola Max is indicated for the distinct nutritional requirements of individuals who have suboptimal 5-MTHF in their cerebrospinal fluid, plasma, and/or red blood cells. It is also indicated for those who have major depressive disorder (MDD), with particular emphasis as adjunctive support for individuals who are on an antidepressant. Fola Max is indicated regardless of MTHFR C677T polymorphism genotype.

It is important to note that folic acid, when administered in daily doses above 0.1 mg, may obscure the detection of B12 deficiency.

See page two of the Fola Max Product Detail Sheet for additional information on the clinical pharmacology, contraindications, precautions, patient information, and interaction with drugs for Fola Max.

USP (United States Pharmacopeia) Dissolution Rate, USP-Grade Excipients

To support excellent quality and provide for the extended release of Quatrefolic, Fola Max has been designed to meet the criteria for rate of dissolution and disintegration according to USP 711 Dissolution, Method A for delayed-release dosage forms. In addition, the natural-source excipients used in Fola Max are USP grade, meaning they meet all of the specifications the USP establishes in their monograph for each ingredient.

*Medical foods are "intended for the specific dietary management of a disease or condition for which distinctive nutritional requirements, based on recognized scientific principles, are established by medical evaluation" (section 5(b)(3) of the Orphan Drug Act (21 U.S.C. 360ee(b)(3)). Such patients may have a limited or impaired capacity to ingest, digest, absorb, or metabolize ordinary foodstuffs or certain nutrients, or have other special medically determined nutrient requirements that cannot be achieved by modification of the normal diet alone.

One tablet of Fola Max delivers the following:

Folate (from 28 mg Quatrefolic®(6S)-5-methyltetrahydrofolic acid, glucosamine salt)	15 mg
--	-------

INGREDIENTS: Dicalcium phosphate, microcrystalline cellulose, coating (talc, shellac, vegetable glycerin, L-arginine, vegetable magnesium stearate, silica, sodium alginate, titanium dioxide, riboflavin 5'-phosphate sodium), vegetable stearic acid, Quatrefolic®(6S)-5 methyltetrahydrofolic acid, glucosamine salt), vegetable magnesium stearate, and croscarmellose sodium.

Quatrefolic® Quatrefolic® is a registered trademark of Gnosis S.p.A. Produced under US patent 7,947,662.

Directions

Take one tablet daily, or as directed by your physician.
