

Simply follow these four steps to manually install the software/firmware for your Asgard™ speaker, by using a USB memory stick.

Step 1) Copy the firmware file/s onto a freshly formatted USB memory stick (FAT32 formatted).

Step 2) Power ON the speaker. Once it is booted up, insert USB stick into speaker.

Step 3) Press and hold VOL+ and MUTE buttons simultaneously for 4-5 seconds until LEDs power OFF.
Now Speaker will reboot and install the Firmware.
During installation, all five LEDs will flash brightly.*
After 1-2 mins the speaker will reboot automatically.*

Step 4) When speaker has finished rebooting it needs to be reset and thereafter re-connected to your Wi-Fi network again. Reset is done by pressing and holding the Vol- and Vol+ buttons simultaneously for 4-5 seconds until speaker reboot.

*PS: If you has installed the "in shop DEMO Firmware", then speaker just need to be reset.
A speaker running the DEMO firmware cannot connect to a Wi-Fi Network.
(This is only for dealers who use the "in shop DEMO Firmware").*

*PS: If all 5 LEDs keep flashing (more than 4 minutes), then the speaker cannot read correctly from the USB stick. Please try to reformat the USB stick or try to use another USB stick.
