## CONTROLS

**Gain:** Sets the amount of gain applied to your guitar signal passing through the fuzz circuit.

**Tone:** Controls the signal's frequency response after distortion. Left of center cuts highs and right of center cuts lows.

**Volume:** Sets the overall output volume of the pedal.

# MODES

**Gate:** Lowers bias voltage in the main fuzz section, creating a gated and starved sound.

Note: Changing the bias lowers the overall level of the pedal compared to the other modes. With plenty of gain on tap, use the Volume slider to compensate.

**Classic:** Screaming fuzz with an iconic mid scoop, give you a compressed and crunchy sound.

**Mid+:** Adds mid boost to flatten out the tone stage, resulting in a compressed but rich and full sound.
