TRANSIT

TRANSIT LOOPER SYSTEM INSTRUCTION MANUAL

Thank you for purchasing the Walrus Audio Transit. The Transit is a True Bypass Looper system useful for organizing your pedalboard and giving your pedals the benefit of True Bypass. The Transit can also be used to create a Signal Loop, which may contain any number of pedals all activated by a single switch. These pedals are effectively True Bypass as well.

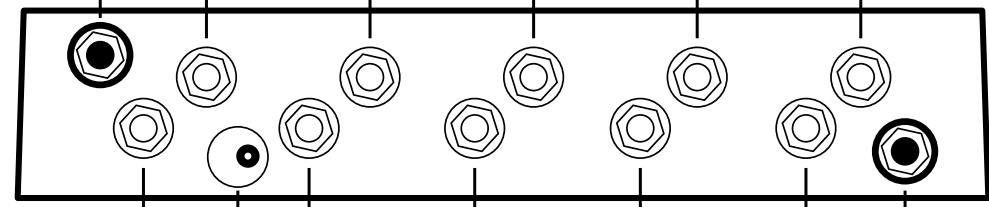

The Deluxe Transit Clickless Looper System features a clickless switching system that provides an unprecedented amount of silence when turning on and off the channels. It contains the same abilities as the Standard Transit Looper but with the addition of studio-grade functionality.

Channel On/Off Switch - Press switch to turn on selected channel (effect mode) and to turn off selected channel (bypass mode). In effect mode, the corresponding LED will be on. In bypass, the LED will be off.

Main Input Jack - Instrument cable to guitar.

Effect Receive - Instrument patch cable to Output of secondary effect.

Power - Activated by 9-Volt power supply.

Effect Send - Instrument patch cable to Input of secondary effect.

Main Output Jack - Instrument cable to amplifier.
