

# ProKure<sup>®</sup> D

## Usage Instructions

### Step 1: Identify ProKure D placement locations.

ProKure D pouches and trifolds hang from the ceiling 18-24" above the plant canopy. They should be spread evenly in a grid of rows and columns taking airflow into consideration. Once you have determined where ProKure D will be placed in your space, proceed to Step 2.

### Step 2: Prep empty ProKure D trifolds for placement.

Before hanging empty trifolds, prep each one by affixing a 30-day countdown sticker and a color sticker on the outside of the trifold. We recommend using two colors (our example shows red and blue stickers) in order to evenly create two separate groups of trifolds: 50% red, 50% blue. This will help you visually understand which group to swap with new ProKure D pouches after 30 days.

Once the stickers have been applied, assemble the trifolds. To do this, fold the trifold flaps above the tray, then press the button snaps securely together. With the trifold in its assembled form, place the sponges in the recessed area at the bottom of the tray.

### Step 3: Hang ProKure D trifolds in placement locations.

Evenly distribute the two groups of empty trifolds in your space. See image to the right for reference on how even distribution is achieved. We recommend that you use a plastic hook to hold these closed trifolds, instead of tying them shut, for ease of opening and closing.

### Step 4: Initiate ProKure D coverage and rotation schedule.

Activate the first group of ProKure D – in this example, we show activation of just **Group Blue**. OPEN AND ACTIVATE ONE PROKURE D POUCH AT A TIME. At each placement location for **Group Blue**, tear open the foil packet and remove the inner white pouch. DO NOT OPEN THE INNER WHITE POUCH. Place the white pouch on top of the raised area of the trifold tray, above the sponges. Press to initiate the 30-day countdown sticker on the outside of the trifold. Do this until all **Group Blue** trifolds are holding an activated ProKure D pouch. *Tip: It is important to not let the pouch become wet.*

After two weeks, activate the second group of ProKure D – in this example, this is **Group Red** – following the same instructions as above.

### Step 5: Ongoing Rotations

**For pouches:** Activated ProKure D pouches will need to be swapped with new pouches every 30 days. You can plan on when to swap your pouches manually (marking your calendar 30 days in advance for each group) and/or you can use the 30-day countdown sticker as an indicator for when 30 days has passed. For each ProKure D pouch swap, be sure to replace and activate a new 30-day countdown sticker. *Note: The ideal ProKure D rotation schedule refreshes 50% of the activated pouches in the room every two weeks. This is done to best maintain preferred levels of ClO<sub>2</sub>.*

**For sponges:** If, at any point, you notice a sponge getting wet within a trifold, replace it with a dry one. *Tip: We recommend checking sponges for wetness every 3-5 days.*
