

# Drinking Water Quality and Compliance SaskWater Buffalo Pound Potable Water Supply System - North 2022 Notification to Consumers

The Water Security Agency (WSA) requires that, at least once each year, waterworks owners provide notification to consumers of the quality of water produced and supplied as well as information on the performance of the waterworks in submitting samples as required by a Permit to Operate a waterworks. The following is a summary of the SaskWater Buffalo Pound Potable Water Supply System - North water quality and sample submission compliance record for the <u>January 1, 2022 to December 31, 2022</u> time period. This report was completed on February 1, 2023. Readers should refer to WSA's <u>Municipal Drinking Water Quality Monitoring Guidelines</u> for more information on minimum sample submission requirements and types of samples. Permit requirements for a specific waterworks may require more sampling than outlined in the Agency's monitoring guidelines. If consumers need to know more about drinking water, more detailed information is available from: <a href="http://www.hc-sc.gc.ca/ewh-semt/pubs/water-eau/index-eng.php">http://www.hc-sc.gc.ca/ewh-semt/pubs/water-eau/index-eng.php</a>.

# **BACTERIOLOGICAL QUALITY**

| Parameter           | Limit                | Regular Samples<br>Required | Regular Samples<br>Submitted | # Positive of Regular<br>Submitted |
|---------------------|----------------------|-----------------------------|------------------------------|------------------------------------|
| Total Coliform      | 0 Organisms/100 mL   | 24                          | 52                           | 0                                  |
| E. Coli             | 0 Organisms/100 mL   | 24                          | 52                           | 0                                  |
| Background Bacteria | Less than 200/100 mL | 24                          | 52                           | 0                                  |

Analysis is performed on a single sample for all parameters mentioned above. All waterworks are required to submit samples for bacteriological water quality; the frequency of monitoring depends on the population served by the waterworks. Additional testing was done for informational purposes.

## **WATER DISINFECTION**

Chlorine Residual in Distribution System - From Test Results Submitted with Bacteriological Samples

| Parameter      | Minimum Limit (either/or) | Range (mg/L) | # Tests<br>Required | # Tests<br>Submitted | # Adequate<br>Chlorine |
|----------------|---------------------------|--------------|---------------------|----------------------|------------------------|
| Free Chlorine  | 0.10 mg/L                 | 0.22 - 1.33  | 24                  | 52                   | - 52                   |
| Total Chlorine | 0.50 mg/L                 | 0.59 – 1.74  | 24                  | 52                   | 32                     |

A minimum of 0.1 milligrams per litre (mg/L) free chlorine residual OR 0.5 mg/L total chlorine residual is required at all times throughout the distribution system. An adequate chlorine is a result that indicates that the chlorine level is above the regulated minimums. A waterworks is required to submit chlorine residual test results on every bacteriological sample they submit. Additional testing was done for informational purposes.

#### Free Chlorine Residual for Water in the Distribution System

| Minimum       |              | Average      | # Tests | # Tests    | % Adequate |          |
|---------------|--------------|--------------|---------|------------|------------|----------|
| Parameter     | Limit (mg/L) | Range (mg/L) | (mg/L)  | Required   | Performed  | Chlorine |
| Free Chlorine | 0.10         | 0.16 – 1.67  | 0.79    | Continuous | Continuous | 100      |

Residuals are continuously monitored and recorded. Tests performed by waterworks operators are to be recorded in operation records.

#### **Buffalo Pound North Water Supply System**

#### **TURBIDITY**

Turbidity in the Distribution System – From Test Results Submitted with Bacteriological Samples

|  |           |             | # Tests     | # Tests  | # Exceeding |       |
|--|-----------|-------------|-------------|----------|-------------|-------|
|  | Parameter | Limit (NTU) | Range (NTU) | Required | Performed   | Limit |
|  | Turbidity | No standard | 0.05 - 0.16 | 0        | 52          | 0     |

Turbidity is a measure of water treatment efficiency. Turbidity measures the "clarity" of the drinking water and is reported in Nephelometric Turbidity Units (NTU). Additional testing was done for informational purposes.

## <u>CHEMICAL – TRIHALOMETHANES (THM)</u>

Trihalomethanes are formed when chlorine reacts with organic matter in water. The four THM compounds are: chloroform, dibromochloromethane, bromodichloromethane (BCDM) and bromoform. The sum of the concentrations of these four components is referred to as Total Trihalomethanes. The limit for THM is a long term objective based on an annual average of seasonal samples. Additional testing was done for informational purposes.

| Parameter      | Maximum<br>Limit (mg/L) | Average<br>(mg/L) | # Samples<br>Required | # Samples<br>Submitted |  |
|----------------|-------------------------|-------------------|-----------------------|------------------------|--|
| Trihalomethane | 0.100                   | 0.048             | 4                     | 5                      |  |

## CHEMICAL - HALOACETIC ACIDS (HAAs)

Haloacetic acids are formed when chlorine reacts with organic matter in water. The five regulated haloacetic acids are: monochloroacetic acid, dichloroacetic acid, trichloroacetic acid, monobromoacetic acid, and dibromoacetic acid. The sum of the concentrations of these five components is referred to as HAA5. The limit for HAA5 is a long term objective based on an annual average of seasonal samples.

| Parameter          | Maximum Limit | Average | # Samples | # Samples |
|--------------------|---------------|---------|-----------|-----------|
|                    | (mg/L)        | (mg/L)  | Required  | Submitted |
| Haloacetic Acids 5 | 0.080         | 0.036   | 4         | 4         |

## CHEMICAL – Health

The permit for SaskWater's Buffalo Pound Potable Water Supply System – North does not require sampling for Chemical Health parameters. Additional testing was carried out by SaskWater for informational purposes.

| Parameter | MAC<br>(mg/L) | IMAC<br>(mg/L) | AO*<br>(mg/L) | Sample<br>Results (mg/L) | # of Samples<br>Required | # of Samples<br>Submitted |

Email: <u>customerservice@saskwater.com</u>

<sup>\*</sup>Objectives apply to certain characteristics of or substances found in water for human consumptive or hygienic use. The presence of these substances will affect the acceptance of water by consumers and/or interfere with the practice of supplying good quality water. Compliance with drinking water aesthetic objectives is not mandatory as these objectives are in the range where they do not constitute a health hazards. The aesthetic objectives for several parameters (including hardness as CaCO<sub>3</sub>, magnesium, sodium and total dissolved solids) consider regional differences in drinking water sources and quality.
