PLANTING
Remove planter lid and add \( \frac{1}{2} \) cup of water to the soil. Sprinkle 6-8 seeds and push each \( \frac{1}{4}" \) into soil. Place planter in sunny window (8+ hours of direct sunlight) or under a grow light.

GERMINATION
Seeds will germinate in 14-21 days. For best results, keep the top 2" of soil moist by adding water when it looks dry.

WATERING
Lavender is a drought-resistant plant and prefers drier soil after germination. Throughout growth, allow soil to dry out before each new watering.

TIP: Peer through your mason jar to make sure the soil is dry before watering again!
THINNING

When seedlings reach ~3" tall, use your thumb and forefinger to remove all but the 3 strongest seedlings.

TIP: Even at just 3" tall, your plant will give off an aromatic lavender fragrance... go ahead, give it a smell!

FERTILIZING

8 weeks after planting, push 1 fertilizer spike into the soil, away from stems and roots. Add the 2nd spike after flowers appear.

FLOWERING

Lavender normally likes to flower between spring and early fall. Don’t want to wait for flowers? The leaves can be used for nearly all the same things! Visit backtotheroots.com to learn about all the fun ways to use lavender!
