

Swimava®

make bath time more than fun

AGES: 2-4 Years

Body Ring

Swimava Body Ring Instructions – Step by Step:

⚠ Never leave a baby unattended while using the Swimava Body Ring. Always remain within arm's reach of a baby in water.

1. Inflate the Swimava Body Ring

- Insert the pump nozzle firmly into the top air chamber safety valve to break the factory seal. Be careful not to damage the air valve.
- Pump up the top chamber until it is full and feels firm. Next repeat steps with the bottom chamber. If the seams begin to show strain stop inflation and release air to reduce pressure until all signs of stress on the seams are gone. (see Fig. 1&2)
- Ensure each valve is securely plugged after being filled. Regularly check the valves to ensure they are plugged.

- * Do not over inflate the ring.
- * Prior to each use of the Body Ring put the ring completely under water for 60 seconds and check for any air bubbles indicating leakage.
- * The small air pump is not a toy, keep it out of reach of children.

Inflate:

Use pump to inflate, then push valve down firmly to close

Deflate:

Squeeze valve to release air

2. Place the Swimava Body Ring on your baby

- Caregiver #1 should support the baby's upper body while Caregiver #2 fastens the Body Ring. Open the Body ring and gently bring it around the baby's waist from the front or from behind. (see Fig. 3)
- Close the Body Ring securing both the top and bottom buckles. Gently make sure the waist is free from the Body Ring before fastening.
- Always adjust the Body Ring diameter to suit your baby prior to placing him in the pool or bath.
- You should always be able to slide at least 2 fingers in between the Body Ring and your baby all the way around. Watch closely for signs of distress or discomfort. (See Fig.4)
- * You can slightly decrease the lower/inner air chamber pressure to relax the inner ring diameter if the ring feels too tight.
- * The upper air chamber should always be fully inflated.
- * The Body Ring should freely move around the baby's waist and should only be supporting the upper body above the water.

FIG. 3

FIG. 4

3. Test the Water Temperature and Adjust the Water Level

- Fill the Swimava Baby Pool or your bath tub with warm water.
- Adjust the water level so your baby can float and enjoy free movement of his legs in the water while the Swimava Body Ring acts as a gentle support keeping the upper body above the water. (See Fig.5)
- * The water temperature should be approximately 35 degrees Celsius (90 degrees Fahrenheit) with no more than +/- 2 degrees Celsius (+/- 3.6 degrees Fahrenheit) variation. Monitor the water temperature with a floating baby thermometer.

FIG. 5

4. Place your baby in Water

- Support your baby from under his arms while gently placing him in the bath or pool.
- Never leave a baby unattended while using this Swimava Body Ring or any flotation product. Always remain within arm's reach.
- * Do not use bath oils in the water as these can affect the durability of the plastic PVC Swimava Body Ring. This could also make surfaces unexpectedly slippery and lead to an accident when removing your baby from the water.
- * Pay close attention to your baby for signs he is ready to finish bath / swim time. Your baby most certainly will let you know when he has had enough.
- * Although it may be possible for your baby to enjoy the Swimava Body Ring for over 30 minutes per session, this should not be exceeded.

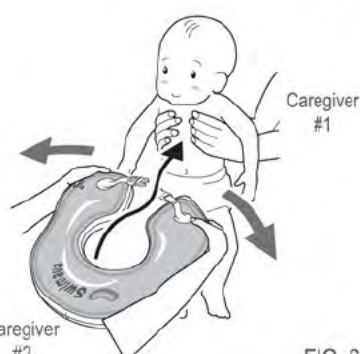

FIG. 6

5. Take your baby out of Water

- Two Caregivers should always be present when taking your baby out of water.
- Caregiver #1 should hold the baby firmly under the arms while lifting the baby out of water. Caregiver #2 should slowly remove the Swimava Body Ring.
