◎ MLA GOLF TOUR XDREAM PUTTER

MLA Golf has developed a patented alignment technology that will revolutionize your putting. This is how it works: we all have internal guides to compare and analyze sensory information that control pace and direction of putts. MLA Putters worked with Dr. Lennart Högman, Ph.D., who has studied the perceptual process for more than 20 years and has performed studies that have revised the science between the human's perceptions and the human being's motor skills. He says: "An alignment system that acts upon multiple line detectors is a key to obtain veridical motion perception and a perfect in-line stroke surface." The brain consists of

100,000 line detectors that are divided into a number of groups that help us decide what is straight. A simple line, for example, activates a group of detectors. When several groups of detectors are activated, these help the brain to make correct judgments. MLA putters are designed to take advantage of these guides. Their patented alignment technology activates the maximum number of coordinated detectors for optimal aiming judgment. The Tour XDream putter pushes everything to its limits — perfect weight distribution with all benefits of greater roll and higher MOI, including an interchangeable weight system along with the world leading U.S. patented alignment system, will make this putter the most important club in your bag. It's 100 percent CNC milled. **\$349 • www.MLA.golf**

◎ ECCO GOLF SHOES

Hear that sound? It's the clear and constant peal of applause from golfers around the world who appreciate ECCO's craftsmanship and attention to golf-specific detail. Their shoes are comfortable, sturdy and designed to dazzle, and that includes their off-the-links models, too.

Start with the ECCO S-Drive, which represents an entirely new take on golf footwear. Drawing inspiration from the running market, the bold, athletic styling is matched with a simple, yet highly-technical asymmetrical latch to enhance both fit and feel. The result is a lightweight, agile design that still offers the comfort, stability and performance golfers demand. Their design includes an asymmetrical closure system enables a revolutionary, close-to-the-foot fit, resulting in excellent support and stability, and a soft mesh upper for a comfortable feel. Bonding it all together is microfiber for optimal support and stability, and the shoe is treated with Hydromax for superb weather and perspiration resistance. A removable Ortholite inlay sole offers long-term cushioning, enhanced breathability, antimicrobial function and the option of extra width; the wrap-up on the side of the midsole adds support during golf swing, while direct-injected TPU outsole features E-DTS technology for excellent grip, traction, durability and flexibility.

Among the non-golf athletic shoes, check out the ECCO BIOM Venture for men and women with its extreme 360-degree breathability. The Venture features an open mesh speedlace upper and an asymmetrical collar and tongue construction for a better fitted ankle position and foot support and lightweight, athletic flexibility. The waterproof construction increases breathability from all angles and its low-to-the-ground sole construction pro-

vides a natural foot position and excellent ground adaptation. Direct-injected PU midsole foam and BIOM last deliver long-lasting cushioning and outstanding comfort. The rough rubber outsole, versatile profile and pedal zone offer enhanced grip for diverse outdoor activities such as light hiking, speed walking, mountain biking, and everyday wear, perfect for rough gravel or forest trails.

Finally there's the ECCO Women's Aspina GTX walking shoe, whose Receptor Lite technology reduces weight while providing dynamic support from ground impact with an outdoor-inspired upper in open mesh with feminine details and a soft, comfortable fit. Gore-Tex waterproof construction ensures dry and comfortable feet in wet-weather conditions. The speedlace and sock construction allows for easy instep and a great fit.
