

Securing a Negative Ground

- In order for your lights to work correctly, you must secure a good ground. The best places to do this are on:
 - The negative terminal of the battery itself
 - A bolt connected to the main frame, (not anywhere on the front end because the bearings don't allow for a good ground)
 - Any other established ground wire in the harness
- Check the continuity if the ground was made on the frame to see if it is a good ground.
