Installation, Operation, and Maintenance Manual

RECEIVING AND INSPECTION

Upon receiving unit, check for any interior and exterior damage, and if found, report it immediately to the carrier. Check that all accessory items are accounted for and free of damage. Turn the blower wheel by hand to verify free rotation and check the damper (if supplied) operates freely.

WARNING!!

Installation of this ventilator should only be performed by a qualified professional who has read and understands these instructions and is familiar with proper safety precautions. Improper installation poses serious risk of injury due to electric shock, contact with rotating equipment, and other potential hazards. Read this manual thoroughly before installing or servicing this equipment. ALWAYS disconnect power prior to working on fan.

Save these instructions: This document is the property of the owner of this equipment and is required for future maintenance. Leave this document with the owner when installation or service is complete.

WARRANTY

This equipment is warranted to be free from defects in materials and workmanship, under normal use and service, for a period of 2-years from date of shipment. This warranty shall not apply if:

- 1. The equipment is not installed by a qualified installer per the MANUFACTURER'S installation instructions shipped with the product.
- 2. The equipment is not installed in accordance with Federal, State, and Local codes and regulations.
- 3. The equipment is misused, neglected, or not maintained per the MANUFACTURER'S maintenance instructions.
- 4. The equipment is not installed and operated within the limitations set forth in this manual.
- 5. The invoice is not paid within the terms of the sales agreement.

The MANUFACTURER shall not be liable for incidental and consequential losses and damages potentially attributable to malfunctioning equipment. Should any part of the equipment prove to be defective in material or workmanship within the 2-year warranty period, upon examination by the MANUFACTURER, such part will be repaired or replaced by MANUFACTURER at no charge. The BUYER shall pay all labor costs incurred in connection with such repair or replacement. Equipment shall not be returned without MANUFACTURER'S prior authorization, and all returned equipment shall be shipped by the BUYER, freight prepaid to a destination determined by the MANUFACTURER.

NOTE: To receive warranty coverage for this product, copy and print out the "Start-up and Maintenance Documentation" on page 52. Fill in all details required. Fax the page to 1-919-516-8710 or call 1-866-784-6900 for information on emailing forms.

INSTALLATION

It is imperative that this unit is installed and operated with the designed airflow and electrical supply in accordance with this manual. If there are any questions about any items, please call the service department at **1-866-784-6900** for warranty and technical support issues.

MECHANICAL

WARNING: DO NOT RAISE VENTILATOR BY THE HOOD, BLOWER OR MOTOR SHAFT, OR BEARINGS – USE LIFTING POINTS PROVIDED OR A SLING.

Site Preparation

- Provide clearance around installation site to safely rig and lift equipment into its final position. Refer to Figure 1 for lifting point locations. Supports must adequately sustain equipment. Refer to manufacturer's estimated weights.
- 2. Consider general service and installation space when locating unit.
- 3. Locate unit close to the space it will serve to reduce long, twisted duct runs.
- 4. The fan discharge must be located at least 10 feet away from any supply intakes. The fan discharge shall be in accordance with the applicable building code provisions.
- 5. Inline fans can be interior mounted, motors shall be located outside of the exhaust air-stream.
- 6. Interior mounted fans must have a grease drain that is piped to an approved grease reservoir.
- 7. Interior mounted fans are considered part of the duct system. Clearance to combustibles must always be maintained. If necessary, the fan may be wrapped to maintain the duct system fire rating.

NOTE: Never Lift Fans From Shafts and Bearings.

Figure 1 - Recommended Lifting Points

Roof Mounting

Ventilators are designed for installation atop a prefabricated or factory-built roof curb. If an up-blast fan is used for kitchen hood exhaust, ensure discharge is at least 40" above the roof surface in accordance with NFPA 96. Refer to Authority Having Jurisdiction (AHJ) requirements prior to installation. Follow manufacturer's instructions for proper curb installation.

1. If a backdraft damper is required, it should be secured within the curb using sheet metal screws to the bottom of a damper box or damper support flanges located below the roof deck.

CAUTION: NFPA 96 RECOMMENDS THAT DAMPERS SHOULD NOT BE INSTALLED WHEN EXHAUSTER IS USED FOR REMOVAL OF SMOKE AND GREASE LADEN VAPORS FROM COMMERCIAL KITCHEN EQUIPMENT. CONSULT STATE AND LOCAL CODES FOR DETAILED REQUIREMENTS.

- 2. On an up-blast fan, normally the power cord is brought through the conduit tube located on the top skirt on the outside of the unit.
- 3. Curb to substrate installation: Secure curb flange to substrate using suitable hardware (not furnished). Refer to **Table 1** and **Table 2** for hardware details.
- 4. Fan to curb installation: Use 1/4"-14 x 2" galvanized self-drilling screws. 19" through 40" fan bases use a minimum of 12 screws (3 per side). 44" fan bases use a minimum of 16 screws (4 per side).
- 5. Before connecting power source to the fan motor, verify power line wiring is de-energized. Check that the power source is compatible with the requirements of your equipment.
- 6. Connect power supply wiring to the motor as indicated on the motor nameplate or terminal box cover.
- 7. Before powering up fan, check ventilator wheel for free rotation.
- 8. Re-install motor cover. Check all fasteners for tightness.
- 9. A drain pipe is provided for single-point drainage of water and residue on up-blast fans. The drain pipe should be positioned towards the roof slope. Some means for collection of this residue must be provided, either a container directly under the trough or use of an adapter and pipe to carry the residue to a remote collection point. An optional downspout and grease collection box is available as an accessory item for up-blast fans.

Wall Mounting

Refer to Authority Having Jurisdiction (AHJ) requirements prior to installation. Follow manufacturer's instructions for proper curb installation.

- 1. The same instructions, warnings, and notes found under Roof Mounting section will apply. Follow steps 1-9 from above, with additional mounting information below.
- 2. **Masonry Wall/Steel Studs:** Around the wall opening, install an angle iron frame at least 2" x 2" x 1/4". Frame should be approximately 1/2" smaller than the inside base dimension of the ventilator. For masonry, secure the lead cinch type anchors with non-ferrous bolts (3 per side). For steel, use self-drilling screws (3) per side. The ventilator should be mounted to the mounting angle iron frame with self-tapping sheet metal screws (3 per side).
- 3. **Wood Sidings:** Around the wall opening, install a wooden frame 2" high x 2" wide. Frame should be approximately 1/2" smaller than the inside base dimension of the ventilator. Secure with counter-sunk expansion type lag bolts (3 per side). The ventilator should then be mounted to the mounting frame with square head wood screws (3 per side) 3/8" minimum.
- 4. Steel wall mount brackets are also available as a factory option for the fan.
- 5. The mounting flange connections should be coated with a suitable caulking compound or an approved waterproof mastic sealer.
- 6. Wall mount application is not recommended for fans greater than 24" wheel with 2 HP motor (1 or 3 phase); 24" wheel with 3 HP motor (3 phase only).

IMPORTANT: OSHA REGULATIONS REQUIRE THE VENTILATOR TO BE MOUNTED AT LEAST EIGHT (8) FEET ABOVE GROUND OR FLOOR LEVEL.

Curb and Ductwork

This fan was specified for a specific CFM and static pressure. The ductwork attached to this unit will significantly affect airflow performance. Flexible ductwork and square elbows should not be used. Also, transitions and turns in ductwork near the fan inlet will cause system effect and will drastically increase the static pressure and reduce airflow. **Follow SMACNA guides and recommendations for the remaining duct run.** Fans designed for rooftop installation should be installed on a prefabricated or factory-built roof curb. Follow curb manufacturer's instructions for proper curb installation.

An example of a curb installation: Curbs should be secured to structural members, such as wooden studs, steel studs, or concrete. The curb should be installed to the roof and/or wall using appropriate type and size fasteners. Refer to **Table 1** for minimum hardware requirements, refer to **Table 2** for quantity per curb flange. Always use suitable fasteners (not furnished) and quantity recommendations.

Refer to **Figure 2** and **Figure 3** for installation details. The fan should be installed on a curb and/or rail. Caulking, flashing, and sealing of wall/roof penetration done by contractor or installer.

Verify that the duct connection and fan inlet are properly aligned and sealed. The fan base is secured to the curb with 1/4"-14 x 2" galvanized self-drilling screws. Use a minimum of 12 screws (3 per side) for units with base sizes 19" through 40". Use a minimum of 16 screws (4 per side) for units with a base size of 44". Shims may be required depending upon curb installation and wall/roofing material. Check all fasteners for tightness.

NOTE: Fan to Curb Installation: Use 1/4"-14 x 2" self-drilling screws. Use a minimum of 12 screws (3 per side) for 19" through 40" fan bases. Use a minimum of 16 screws (4 per side) for 44" fan bases.

Duct Routing

Figure 4 - Examples of Duct Routing

Proper Duct Routing

Use offsets if the duct cannot be routed straight up.

DO NOT connect elbow directly to fan inlet.

DO NOT use square elbows.

Up-blast Wall Mount Details

Drill pilot holes into the bracket.

Secure wall mount bracket to the wall. Refer to Table 1 for hardware details.

Use at least (3) suitable fasteners (not furnished) per side.

Wall bracket fits into base of fan.

Use self-drilling screws to attach unit to the wall mount bracket.

- * "B" dimension = 5" when used with damper.
- ** Centered in wall mount.

Up-blast Roof Mount Installation

Normal temperature test – The exhaust fan must operate continuously while exhausting air at 300°F (149°C) until all fan parts have reached thermal equilibrium, and without any deteriorating effects to the fan which would cause unsafe operation.

Abnormal flare-up test – The exhaust fan must operate continuously while exhausting burning grease vapors at 600°F (316°C) for a period of 15 minutes without the fan becoming damaged to any extent that could cause an unsafe condition.

Pitched curbs are available. Specify pitch when ordering, for example: 7/12 Pitch = 30° Slope

Hinge Kit Field Installation

Attention: Installer Must Supply Enough Electrical Cord to Allow the Fan to Swing Open.

- 1. If parts are not already assembled, refer to Figure 9 for assembly instructions. Assemble the fan plate and curb plate with hardware, as shown in Figure 9 Detail "A" and Detail "B".
- 2. Line up fan base edge to inside edge of fan plate, as shown in Figure 9 Detail "C". Refer to Figure 10 for positioning fan plate on fan base.
- 3. Secure the fan plate to the fan base using sheet metal screws (#14 x 3/4" qty 12). If the screws interfere with the curb, run the screws from the inside of the fan base. Refer to Figure 9 Detail "D". Verify hardware does not interfere with curb when fan swings open or closed.
- 4. Secure the curb plate to the curb using sheet metal screws (#14 x 3/4" qty 12), Figure 9 Detail "C". Verify all parts and hardware are secure and tight. Verify that the fan and base swings open properly, see Figure 10.

Inlet Service Duct Option

Service duct kits allow a quick disconnect between the fan inlet and duct system.

- 1. Service duct kits come with (2) 7" long duct sections, (8) riser rings, and installation hardware.
- 2. Service duct flanges must be sealed with 3M Barrier 2000+.
- 3. Once sealed, the service duct is secured using bolt together riser rings.
- 4. The first 7" long duct section can be welded directly to existing duct systems.
- 5. If connecting to fan Manufacturer's factory duct, the first 7" long duct section may or may not be used. You may connect fan Manufacturer's standard duct directly to service duct using V-bands.

Up-blast Utility Set Indoor Installation

Some situations prevent the installation of exhaust fans on the roof or other outdoor location. An indoor installation may be the only alternative.

Of the various types of fans that might be employed, utility sets seem most appropriate because they readily accommodate the inlet and outlet duct connections. Fans designed for curb mounting would present outlet duct connection difficulties.

Most Authority Having Jurisdictions (AHJs) comply with IMC, NFPA 96 and UL 762 standards. Standard UL 762, "Power Roof Ventilators for Restaurant Exhaust Appliances", covers the utility set high temperature and grease fire testing. NFPA 96 "Standard for Ventilation Control and Fire Protection of Commercial Cooking Operations" covers the installation of the duct connections to the inlet and out of the exhaust fan.

Standard UL 762:

This standard has two primary tests. The first test has the fan exhaust air for several hours at the maximum temperature the manufacturer wishes to list the fan, such as 300°F. The second part imitates a grease fire by igniting grease in a pan near an inlet duct. If the fan keeps running and does not display any unsafe results, it passes those tests. They also examine the fan for any characteristics that might be unsuitable.

In the scope of section 1.1, it states, "these requirements cover roof or wall-mounted ventilators for restaurant exhaust appliances." It would seem at first that the phrase "roof or wall mounted" would preclude applicability of the label indoors. However, in the very next paragraph it goes on to say, "Power ventilators...covered by these requirements are intended for installation in accordance with ... NFPA 96". NFPA 96 clearly defines how to install a traditional ventilator indoors.

Standard NFPA 96 - 8.1.4* Utility Set Exhaust Fans.

- **8.1.4.2** Utility set exhaust fans installed within the building shall be located in an accessible area of adequate size to allow for service or removal.
- **8.1.4.3** Where the duct system connected to the fan is in an enclosure, the space or room in which the exhaust fan is located shall have the same fire resistance rating as the enclosure.
- **8.1.4.4** The fan shall be connected to the exhaust duct by flanges securely bolted, as shown in Figure 8.1.3.2 (a) through Figure 8.1.3.2 (d) or by a system specifically listed for such use, such as UL 1978 or UL 2221 listed duct systems.
- **8.1.4.5** Flexible connectors shall not be used.
- **8.1.4.6** Exhaust fans shall have a drain directed to a readily accessible and visible grease receptacle not to exceed 3.8 L (1 gallon).

Manufacturer Recommendations for Indoor Installation:

- The fan inlet and outlet must be connected to the ducts using companion flanges and high temperature (1500F) gaskets or by a system specifically listed for such use, such as UL 1978 or UL 2221 listed duct systems.
- 2. Install the fan where there is room for service and removal.
- 3. Usually, the duct to the fan is in a shaft, and the shaft walls have a fire resistance rating. The space where the fan is located must have the same fire resistance rating as the shaft.
- 4. Flexible connectors are not allowed.
- 5. There must be a drain in the fan that is directed to a readily accessible and visible grease receptacle, ideally piped to the building grease trap.
- 6. The exhaust housing constructed of carbon steel not less than 1.52 mm (.060 in.), unless listed in accordance with the terms of the listing.
- 7. Inlet and outlet ducts will have access doors installed 3 feet from the fan for service and maintenance.
- 8. Minimum clearances are 18" inches to combustible, 3" inches to limited, 0" inches to non-combustibles.
- 9. All wiring and electrical equipment must comply with NFPA 70, National Electrical Code.

Up-blast Curb Mounted Utility Set Hinging Instructions

- 1. Turn the disconnect switch to the off position.
- 2. Turn and release the latch from the power pack handle.
- 3. Lift the power pack using the front handle.
- 4. The power pack will tilt back 65 degrees.
- 5. The power pack latch will automatically engage the spring pin.
- 6. To close the power pack, hold the lifting handle and pull the spring pin up.
- 7. Lower the power pack down.
- 8. Engage the front latch into the lifting handle and twist to lock.
- 9. Inspect the power pack. Top plate should be sealed with top gasket.
- 10. Turn the wheel to make sure there is not any interference.

NOTE: Utility sets may not be wall mounted.

ELECTRICAL

WARNING!!

Disconnect power before installing or servicing unit. High voltage electrical input is needed for this equipment. A qualified electrician should perform this work.

Before connecting power to the fan, read and understand the entire section of this document. As-built wiring diagrams are furnished with each unit by the factory and are attached to the fan or provided with paperwork packet.

Electrical wiring (**Table 3**) and connections must be made in accordance with local ordinances and the National Electric Code, ANSI/NFPA 70. Verify the voltage and phase of the power supply. Confirm the wire amperage capacity is in accordance with the unit nameplate. For additional safety information, refer to AMCA publication 410-96, *Recommended Safety Practices for Users and Installers of Industrial and Commercial Fans.*

- 1. Always disconnect power before working on or near this equipment. Lock and tag the disconnect switch and/or breaker to prevent accidental power-up.
- 2. A dedicated branch circuit should supply the motor circuit with short circuit protection according to the National Electric Code. This dedicated branch should run to the junction box. Every branch circuit should include a properly sized ground connection.
- 3. A disconnect switch is shipped with every fan. The switch may be located on the exterior of the fan or in the interior of the fan. On down-blast direct drive fans, the disconnect function is built into the speed controller.
- 4. Verify that the power source is compatible with the requirements of your equipment. The nameplate identifies the **proper phase and voltage** of the equipment.
- 5. Before connecting the unit to the building's power source, verify that the power source wiring is deenergized. Refer to schematics.
- 6. Secure the power cable to prevent contact with sharp objects. Verify ground connection is secure.
- 7. Do not kink power cable and never allow the cable to encounter oil, grease, hot surfaces, or chemicals.
- 8. Before powering up the unit, make sure that the fan rotates freely. Make sure that the interior of the unit is free of loose debris or shipping materials.
- 9. If any of the original wire supplied with the unit must be replaced, it must be replaced with type THHN wire or equivalent.

IMPORTANT: FANS WITH HINGE KITS REQUIRE ENOUGH SLACK IN THE WIRING TO THE FAN TO ALLOW FAN TO TILT BACK TO THE OPEN POSITION. ELECTRICIAN MUST CHECK THIS AND ACCOUNT FOR THE RANGE OF MOTION OF THE FAN.

Permanent Split Capacitor (PSC) Motor Speed Control

Some single-phase direct-drive fans contain speed controls that regulate the amount of voltage going to the motor. Specific PSC motors must be used in conjunction with speed controls. The speed control has a knob (**Figure 30**) with an off position along with high to low range. At high speed, the speed control allows all of the line voltage to pass directly to the motor.

A minimum speed adjustment is provided to allow independent control of the minimum speed setting. Minimum speed adjustment ensures the motor runs with sufficient torque to prevent stalling. To adjust this:

Figure 30 - PSC Motor Speed Control

- 1. Motor must be in actual operating conditions to achieve proper speed adjustment. Motor will not slow down unless proper load is applied.
- 2. Turn main control knob to lowest speed position.
- 3. Locate and adjust minimum speed setting. This can be found under the speed control faceplate. Use a small screwdriver to adjust. Rotate clockwise to decrease minimum speed; counter-clockwise to increase minimum speed.
- 4. Motor will now operate from this preset minimum speed to full speed.

The lowest minimum voltage that may be applied to these motors is 65V AC. Running lower voltages to the motor can cause premature failure and overheating problems.

Motorized Intake Damper

On units shipped with the optional motorized intake damper, a power transformer is supplied with the unit if the main incoming voltage is greater than 120V. The damper motor is automatically energized when the main disconnect switch is in the ON position. **No external wiring to the damper motor is required.**

Electronically Commutated Motor (ECM) Speed Control

An Electrically Commutated Motor (ECM) with speed control allows for an accurate manual adjustment of the fan's speed. The benefits of using an EC motor is exceptional efficiency, performance, and motor life.

Unit Mount Controller

The RTC speed controller features a 4 digit LED display with a five button interface. All parameters can be accessed through the user menu. The percent of run speed can be changed by using the **Up** and **Down** buttons followed by pressing **Enter** (middle button) to save changes. Every **ten seconds** the display will toggle between current percentage of run speed and current RPMs. The flow index has a range of **0-100%** and is typically linear with motor RPM.

If the remote function (re) is enabled, the speed is controlled through a **0-10V** input. **0V = 0%** and **10V = 100%**, unless overridden by the low speed and high speed limits.

The speed controller requires a **24V AC** input and can locally turn the motor on and off. The motor RPM range is fully adjustable between the minimum and maximum setpoints, see LSPD and HSPD on the programming display. For more information, see the RTC control operating manual.

For all motors except 16Z, 18Z, 20Z, 22Z, 25Z, 28Z: If "oFF" is being displayed, and the speed is set above 300 RPM, the ECM is not receiving RPM feedback. Check that the ECM is wired correctly. Check that the motor "tyP" in the settings matches the motor manufacturer. 16Z, 18Z, 20Z, 22Z, 25Z, 28Z do not send RPM feedback.

NOTE: A Variable Frequency Drive (VFD) is required to adjust the speed control of a nonelectrically commutated 3-phase direct-drive motor.

Figure 31 - RTC Speed Controller and Menu

External PWM Signal

Figure 32 illustrates ECM fan wiring. The fan unit will be shipped with power wiring and communication wiring fed to an internal junction box (J-Box). The fan is shipped with Shielded Twisted Pair (STP) wire, which is used for wiring to a remote PWM signal. Power the unit off. Remove top cover from fan. Remove J-Box cover to access wiring connections.

- The STP wire is connected to the communication wiring of the motor using wire nuts in the junction box. If a preset length of STP is provided, it will be connected to wiring located in junction box from the factory.
- If wiring is not connected from the factory, connect the red wire to the positive PWM signal and the black wire to the negative PWM signal. Reference schematics for all wiring connections (PxA and PxB).
- Run STP wiring through the cooling tube and along the power wiring of the fan, secure the two together with zip ties. Ensure there is enough slack for the fan to hinge open and close freely.
- · Refer to wiring schematics to verify wiring and connections.

Figure 32 - ECM Fan Wiring

Motor Speed Controller (MSC) Installation

The Motor Speed Controller (MSC) is a versatile device able to output various signal types to many different Electrically Commutated Motors (ECMs). The MSC signal output types can be selected under the 'Motor Type' section of the MSC menu. The MSC may be installed in a fan, remotely in a kitchen space, or in a mechanical room. While this device can be mounted remotely and powered using 24V, it may also be mounted with the fan where it will be exposed to higher voltages. If installed in the fan, the electrical installation must be carried out according to the appropriate regulations (e.g., cable cross-sections, circuit breaker, protective earth [PE] connection). National and local codes must be followed during the installation process.

The MSC board may be powered through a 120VAC/24VAC CLASS 2 transformer, 120V AC/24V DC CLASS 2 power supply, or through MODBUS connections.

The MSC contains static sensitive components. Therefore, you must handle with care to avoid damage to these components. All operations concerning installation, commissioning, and maintenance must be carried out by qualified, skilled personnel who are familiar with the installation, assembly, commissioning, and operation of the electronic board and the application for which it is being used.

Ensure proper handling and avoid excessive mechanical stress. Do not bend any components when handling or installing component. **Do not touch any electronic components or contacts**.

Precautions must be adhered to during installation, testing, servicing, and repairing of this board. Component damage may result if proper procedures are not followed.

Do not install the MSC where it is subjected to adverse environmental conditions such as combustibles, oils, hazardous vapors, corrosive chemicals, excessive dust, moisture, direct sunlight, or extreme temperatures. When removing or installing the MSC to the j-box, verify the gasket is present. All electrical connections for the MSC are located on the backside of the controller. Refer to **Figure 33** for details on installation and electrical connections. When the micro USB programming port is not in use, place the weather-seal plug into the port location.

Figure 33 - Installation/Electrical Connections

33

MSC Controls Overview

There are four buttons to navigate through the menu screens, refer to Figure 34.

Press the **MENU** button to access menu settings/parameters, pressing **MENU** will also back out of the current menu screen. To scroll through menus, use **UP** and **DOWN** buttons. Press the **ENTER** button to change setting/parameter selection.

To enter password, press MENU, then press **ENTER** when "Board Config" is displayed. Use **UP** and **DOWN** to scroll through numbers, press **ENTER** to advance to the next numerical setting. To save changes, press **MENU** until the screen displays "SAVE CHANGES? [ENTER] TO SAVE." Press the ENTER button to save changes.

Figure 34 - MSC Front Detail View

MSC Menu

Board Config - Password (default is 0225)

- Motor Type User may change motor type between Nidec, Telco 42, Telco 48, Ziehl, 0-10V, Other.
- Control Type This setting adjusts how the fan will be controlled.
 - · Local The fan will be controlled by the MSC.
 - Remote Modbus The fan will be controlled by another master board through the MSC. A
 connection between the 0-10V Out to 0-10V In must be made for start command.
 - Remote 0-10V The fan will be controlled by an external 0-10V signal.
- Speed Settings Provides access to speed and voltage settings.
 - Low Speed Adjustable speed from 20% up to high speed setting, or 0-10V. Setting cannot go above High Speed parameter.
 - **High Speed** Adjustable speed from 100% down to low speed setting, or 10-0V. Setting cannot go below Low Speed parameter.
 - **Set Speed%** Adjustable speed range is dependent on Low Speed and High Speed settings. This controls the output of the motor.
 - **Voltage Range** Only available when Motor Type "OTHER" is selected. Default setting is 24V. 5V, and 10V are also available.

- Modbus # Adjustable Modbus ID. Exhaust Fan range 11-18, Supply Fan range 21 or 22. A VFD and MSC cannot use the same Modbus #.
- Options
 - Feedback Fault If set to ENABLED, the MSC will monitor RPM feedback. If the MSC does not
 receive data for 30 seconds or 70% of the expected RPM, this fault will be displayed. Ziehl motors
 do not provide feedback.
 - 2 Speed The 0-10V output cannot be used when the 2 Speed or Manual Speed options are On, or if the "Control Type" is set to Modbus. When the 0-10V OUT and 0-10V IN terminals are not jumped together, the fan will operate at low speed. When 0-10V OUT and 0-10V IN terminals are jumped together, the fan will operate at high speed.
 - Analog Speed The user may enable/disable the option, and calibrate a potentiometer for proper operation that is connected between the 0-10V OUT and 0-10V IN terminals. When enabled, you must calibrate the potentiometer. Follow the MSC's on-screen instructions. The speed will be adjustable between 0V (low speed) to 10V (high speed).
 - Input Threshold When control type is set to Remote 0-10V, an input threshold will be created for motor control. Refer to Figure 35 on page 36 for threshold examples.
 - **Zero Operation** The user may select how the motor will operate when the 0-10V input is at 0V. The options will be Off or Low Speed (default).
 - **Threshold** Increasing the threshold value will allow for the device to hold its voltage/RPM output while the input is between the 0 threshold value.
- Restore Settings Provides access to restore factory settings, and test & balance settings.
 - Factory Settings This will reset all values back to factory settings.
 - T & B Settings This will reset all values back to last saved test & balance settings.
- **Change Password** Users may update the password setting to their own. Password 0225 will also be stored for backup. Both passwords will allow users to enter "Board Config" settings.

Software Version - Displays the current software version installed on the board.

Faults - This provides access to "Fault History," "Fault Totals," and "Clear Faults."

- **Fault History** Displays fault history and board reboots in chronological order. Possible displayed faults are:
 - No Faults There are no active faults with the system.
 - Feedback Fault Only displayed for motors with feedback capabilities.
 - **Reboot** Any time the fan goes from OFF to ON, this "fault" will be logged. This fault will only display in "Fault History."
 - Modbus Issue with Modbus communication between the MSC and master board.
 - Variable Device Fault When "Analog Speed" is selected and a potentiometer is connected, if the voltage drops below 1V, this fault will be displayed.
- Fault Totals Displays amount of faults for Modbus, Feedback, Var Device, Reboot, and Total Faults.
- Clear Faults Users may clear all faults from the board.

Service - This provides access to service settings. Password: 1234

- Save T & B After the test & balance process has been completed, save adjustments under this menu.
- IO Status Provides access to information about the inputs and outputs of the MSC board.
 - V In Displays the incoming voltage (0-10V) to the MSC.
 - **V Out** Displays the output voltage (0-10V) to the motor.
 - RPM Displays motor RPM feedback. Ziehl motors do not provide feedback.
 - **PWM V** Displays equivalent voltage reading of the PWM output to the motor.
 - **Speed%** Displays PWM percentage output value to the motor.

Variable Frequency Drive (VFD)

WARNING!!

- Before installing the VFD drive, ensure the input power supply to the drive is OFF.
- The power supply and motor wiring of the VFD must be completed by a qualified electrician.
- The VFD is factory programmed, only change if replaced or ordered separately.

Consult the VFD manual and all documentation shipped with the unit for proper installation and wiring of the VFD. The VFD has been programmed by the factory with ordered specific parameters. Use **Table 4** as a guide during installation.

Table 4 - VFD Installation Check List

Check Off	Description
	The installation environment conforms to the VFD manual.
	The drive is mounted securely.
	Space around the drive meets the drive's specification for cooling.
	The motor and driven equipment are ready to start.
	The drive is properly grounded.
	The input power voltage matches the drive's nominal input voltage.
	The input power connections at L1, L2, and L3 are connected and tight. Verify correct size crimp fitting is used.
	The input power protection is installed.
	The motor's power connection at U, V, and W are connected and tight. Verify correct size crimp fitting is used.
	The input, motor, and control wiring are run in separate conduit runs.
	The control wiring is connected and tight.
	NO tools or foreign objects (such as drill shavings) are in the drive.
	NO alternative power source for the motor (such as a bypass connection) is connected - NO voltage is applied to the output of the drive.

VFD Installation

Input AC Power

- Circuit breakers feeding the VFDs are recommended to be thermal-magnetic and fast-acting. They
 should be sized based on the VFD amperage. Refer to Table 5 on page 42. See installation schematic
 for exact breaker sizing.
- Every VFD should receive power from its own breaker. If multiple VFDs are to be combined on the same breaker, each drive should have its own protection measure (fuses or miniature circuit breaker) downstream from the breaker.
- Input AC line wires should be routed in conduit from the breaker panel to the drives. AC input power to
 multiple VFDs can be run in a single conduit if needed. Do not combine input and output power
 cables in the same conduit.
- The VFD should be grounded on the terminal marked PE. A separate insulated ground wire must be provided to each VFD from the electrical panel. This will reduce the noise being radiated in other equipment.

ATTENTION: Do not connect incoming AC power to output terminals U, V, W. Severe damage to the drive will result. Input power must always be wired to the input L terminal connections (L1, L2, L3).

VFD Output Power

- Motor wires from each VFD to its respective motor MUST be routed in a separate steel conduit away
 from control wiring and incoming AC power wiring. This is to avoid noise and crosstalk between drives.
 An insulated ground must be run from each VFD to its respective motor. Do not run different fan output
 power cables in the same conduit.
- VFD mounted in ECP: A load reactor should be used and sized accordingly when the distance between the VFD and motor is greater than specified below. The load reactor should be installed within 10 feet of the VFD output:

208/230V - Load reactor should be used when distance exceeds 250 feet.

460/480V - Load reactor should be used when distance exceeds 50 feet.

575/600V - Load reactor should be used when distance exceeds 25 feet.

 VFD mounted in fan: The load reactor should be sized accordingly when the VFD is mounted in the fan.

208/230V - Load reactor is optional but recommended for 15 HP and above motors.

460/480V - Load reactor is optional but recommended for 7.5 HP and above motors.

575/600V - Load reactors are required for all HP motors.

• If the distance between the VFD and the motor is extremely long, up to 1000 FT, a dV/dT filter should be used, and the VFD should be increased by 1 HP or to the next size VFD. The dV/dT filter should be sized accordingly and installed within 10 feet of the output of the VFD.

208/230V - dV/dT filter should be used when distance exceeds 400 feet.

460/480V - dV/dT filter should be used when distance exceeds 250 feet.

575/600V – dV/dT filter should be used when distance exceeds 150 feet.

- Do not install a contactor between the drive and the motor. Operating such a device while the drive is running can potentially cause damage to the power components of the drive.
- When a disconnect switch is installed between the drive and motor, the disconnect should only be operated when the drive is in a STOP state.

VFD Programming

Programming

- 1. The Drive should be programmed for the proper motor voltage. P107 is set to 0 (Low) if motor voltage is 120V AC, 208V AC or 400V AC. P107 is set to 1 (High) if the motor voltage is 230V AC, 480V AC, or 575V AC.
- 2. The Drive should be programmed for the proper motor overload value. P108 is calculated as Motor FLA x 100 / Drive Output Rating (refer to **Table 5 on page 42**).

To enter the PROGRAM mode to access the parameters:

- 1. Use the buttons on the VFD screen (**Figure 37**) to adjust VFD settings. Press the Mode (M) button. This will activate the password prompt (PASS).
- 2. Use the Up and Down buttons to scroll to the password value (the factory default password is "0225") and press the Mode (M) button. Once the correct password is entered, the display will read "P100", which indicates that the PROGRAM mode has been accessed at the beginning of the parameter menu.
- 3. Use the Up and Down buttons to scroll to the desired parameter number.
- 4. Once the desired parameter is found, press the Mode (M) button to display the present parameter setting. The parameter value will begin blinking, indicating that the present parameter setting is being displayed. The value of the parameter can be changed by using the Up and Down buttons.
- 5. Pressing the Mode (M) button will store the new setting and exit the PROGRAM mode. To change another parameter, press the Mode (M) button again to re-enter the PROGRAM mode. If the Mode button is pressed within 1 minute of exiting the PROGRAM mode, the password is not required to access the parameters. After one minute, the password must be re-entered to access the parameters again.

P500 parameter provides a history of the last 8 faults on the drive. It can be accessed without entering PROGRAM mode.

Figure 37 - VFD Screen

NOTE: When a parameter is changed in the drive, the drive should be de-energized. Wait for the display to go completely dark. Once the display is completely dark, the drive can be re-energized.

START-UP OPERATION

Before starting up or operating the unit, verify all fasteners are secure and tight. Check the set screw in the wheel hub, bearings, and the fan sheaves (pulleys). With power **OFF** to the unit or before connecting the unit to power, turn the fan wheel by hand. Verify it is not striking the inlet or any obstructions. If necessary, re-center.

Special Tools Required: Standard Hand Tools, AC Voltage Meter, Tachometer

Start-up Procedure

- 1. Check all electrical connections are secure and tight.
- 2. Inspect the condition of the intake damper and damper linkage, if applicable.
- 3. Inspect the air-stream for obstructions or debris in wheel.
- 4. Compare the supplied **motor voltage** with the fan's nameplate voltage. If this does not match, correct the problem.
- 5. Place the external disconnect to the **ON** position to start the unit. Immediately place the disconnect switch off. **Check the rotation of the fan** with the directional arrow on the blower scroll. Reversed rotation will result in poor air performance, motor overloading and possible burnout. For units equipped with a single-phase motor, check the motor wiring diagram to change rotation. For 3-phase motors, any two power leads can be interchanged to reverse motor direction.
- 6. When the fan is started, observe the operation and check for any unusual noises.
- 7. Place the external disconnect switch back to the **ON** position. The system should be in full operation with all ducts attached. Measure the system airflow. The motor sheave (pulley) is variable pitch and allows for an increase or decrease of the fan RPM. If an adjustment is needed, refer to "Pulley Adjustment" on page 44. Refer to "Pulley Combination Chart" on page 48 for adjustment specifications.
- 8. Once the proper airflow is achieved, measure and record the fan speed with a reliable tachometer.

 Caution Excessive speed will result in motor overloading or bearing failure. Do not set fan RPMs higher than specified in the maximum RPM chart. Refer to "Troubleshooting" on page 49 for more information.
- Measure and record the voltage and amperage to the motor. Compare with the motor's nameplate to
 determine if the motor is operating under safe load conditions. Once the RPM of the ventilator has
 been properly set, disconnect power. Re-check belt tension and pulley alignment, refer to "Pulley
 Alignment/Proper Belt Tension" on page 45.

Pulley Adjustment

The adjustable motor pulley is factory set for the RPM specified (**Table 6**). Speed can be increased by closing or decreased by opening the adjustable motor sheave. Two groove variable pitch pulleys must be adjusted to an equal number of turns open or closed. Any increase in speed represents a substantial increase in horsepower required by the unit. Motor amperage should always be checked to avoid serious damage to the motor when the speed is varied. Always torque set screws according to the torque specifications shown in **Figure 38**.

Pulley Alignment/Proper Belt Tension

- 1. Belts tend to stretch and settle into pulleys after an initial start-up sequence. **Do not tension belts by changing the setting of the motor pulley**, this will change the fan speed and may damage the motor.
 - To re-tension belts, turn OFF power to the fan motor.
 - Loosen all fasteners that hold the blower motor plate to the blower housing.
 - Rotate the motor to the left or right to adjust the belt tension. Belt tension should be adjusted to allow 1/64" of deflection per inch of belt span. Use extreme care when adjusting V-belts as not to misalign pulleys. Any misalignment will cause a sharp reduction in belt life and produce squeaky noises. Over-tightening will cause excessive belt and bearing wear as well as noise. Too little tension will cause slippage at start-up and uneven wear.
 - Whenever belts are removed or installed, never force belts over pulleys without loosening motor first to relieve belt tension. When replacing belts, use the same type as supplied by the manufacturer. On units shipped with double groove pulleys, matched belts should always be used.
- 2. All fasteners should be checked for tightness each time maintenance checks are performed before restarting unit.

Belt tension examples:

- Belt span 12" = 3/16" deflection
- Belt span 32" = 1/2" deflection

Figure 39 - Pulley Alignment/Belt Tension

Bushing Information

Removing Fan Wheel

Location of hardware differs depending on hub configuration in **Figure 41 on page 47**. Refer to **Figure 40** for details on removing fan wheel from motor shaft.

- 1. Loosen set screw on bushing (excludes fan wheels that use H bushing).
- 2. Remove mounting bolts from bushing.
- 3. There are threaded holes provided on the bushing. These holes are used for removing the bushing. Using mounting bolts from previous step; slowly thread bolts into threaded holes in the bushing. Alternate tightening bolts after each full turn.
- 4. Continue until fan wheel can be removed by hand.
- 5. Remove mounting bolts on motor and remove motor shaft from fan wheel.

Figure 40 - Fan Wheel Removal from Motor Shaft

Installing Fan Wheel

Refer to Figure 41 for fan bushing assembly details. Bushing type is stamped on the face of the bushing.

- 1. Place bushing key into bushing slot **(A)**, excludes H bushing.
- 2. Install bushing into wheel hub. Align bushing key with hub keyway (B).
- 3. Use blue Loctite on the mounting bolts.
- 4. Install wheel assembly so that the bushing keyway (C) is aligned with the motor's shaft key (D).
- 5. For Direct Drive motors, make sure the bushing is flush to the tip of the motor shaft.
- 6. For Belt Drive motors, make sure the wheel is properly aligned to the inlet.
- 7. Tighten set screw to lock shaft key in place. Install bolts and torque to proper setting listed in Table 7.

Troubleshooting

The following table lists causes and corrective actions for possible problems with the fan units. Review this list prior to consulting manufacturer. The following table lists causes and corrective actions for possible problems with the fan units. Review this list before consulting manufacturer.

Airflow Troubleshooting Chart

Problem	Potential Cause	Corrective Action
Fan Inoperative	Blown fuse/Open circuit breaker	Check amperage.
		Check fuse, replace if needed.
		Check circuit breaker.
	Disconnect switch in "OFF" position	Place switch to the "ON" position.
	Incorrect wiring to motor	Inspect motor wiring. Verify connections with wiring diagram located on fan motor.
	Broken fan belt	Replace belt.
	Motor starter overloaded	Check amperage.
		Reset starter.
Motor Overload	Incorrect fan rotation	Verify that the fan is rotating in the direction shown on rotation label.
	Fan speed is too high	Reduce fan RPM.
	Incorrect wiring to motor	Inspect motor wiring. Verify connections with wiring diagram located on fan motor.
	Overload in starter set too low	Set overload to motor's FLA value.
	Motor HP too low	Determine if HP is sufficient for job.
	Duct static pressure lower than design	Reduce fan RPM.
Insufficient Airflow	Incorrect fan rotation	Verify that the fan is rotating in the direction shown on rotation label.
	Poor outlet conditions	Check duct and connections. There should be a straight duct connection to the outlet.
	Intake damper not fully open	Inspect damper linkage. If the linkage is damaged, replace damper motor.
	Duct static pressure higher than design	Check ductwork. Adjust/resize to eliminate or reduce duct losses.
	Blower speed too low	Increase fan RPM. Do not overload motor.
	Supply grills or registers closed	Open/Adjust.
	Dirty/clogged filters	Clean filters. Replace filters if they cannot be cleaned or are damaged.
	Belt slippage	Adjust belt tension.
Excessive Airflow	Blower speed too high	Reduce fan RPM.
	Filters not installed	Install filters.
	Duct static pressure lower than design	Reduce fan RPM.
Excessive Vibration and Noise	Damaged/Unbalanced wheel	Replace wheel.
	Misaligned pulleys	Align pulleys.
	Fan is operating in unstable region of fan curve	Refer to performance curve for fan.
	Bearings need lubrication/Damaged bearing	Lubricate bearings, replace if damaged.
	Fan speed is too high	Reduce fan RPM.
	Dirty/oily belt(s)	Clean belt(s).
	Belt(s) too loose	Adjust, replace if necessary.
	Worn belt(s)	Replace belt(s).

MSC Troubleshooting

Fault	Problem	Potential Cause	Corrective Action
	Feedback Fault on	Disconnected/faulty wiring	
Feedback Fault	MSC Display	No feedback for 30 seconds	Check parameters.
		Less than 70% of RPM	Check duct/fan for obstructions.
Modbus	Modbus fault on MSC	Faulty Cat 5 connection/cable	Find and replace faulty cable.
Modbus	Display	ECPM03 does not recognize device	Verify Modbus # on device is set correctly.
Variable Device Fault	Motor not responding to changes made on	Defective potentiometer	Replace potentiometer.
variable Device Fault	variable device (potentiometer)	Faulty wiring to motor	Find and replace faulty wiring.
		2-Speed switch not working	Check switch and wiring.
Motor not responding	Motor not functioning as expected	Wiring to motor defective	Find and replace faulty wiring.
		Check for other faults on MSC display	If no other faults are present, motor may be defective.

TURN OFF POWER TO THE MOTOR WHILE PROGRAMMING THIS DEVICE.

- If the device has a potentiometer or a 2-Speed switch, a jumper wire can be placed in between the 10V In and 10V Out terminals to rule out a defective device. This will cause the motor to go to HIGH SPEED.
- The IO STATUS menu can be used to verify the inputs and outputs of the device are functioning as expected.
- The FAULT HISTORY menu can be used to keep track of faults while working on the device.

MAINTENANCE

To guarantee trouble-free operation of this fan, the manufacturer suggests following these guidelines. Most problems associated with fan failures are directly related to poor service and maintenance.

Please record any maintenance or service performed on this fan in the documentation section located at the end of this manual.

General Maintenance

- 1. Fan inlet and approaches to ventilator should be kept clean and free from any obstruction.
- 2. All fasteners and electrical connections should be checked for tightness each time maintenance checks are performed before restarting unit.
- 3. These units require very little attention when moving clean air. Occasionally oil and dust may accumulate, causing imbalance. If the fan is installed in a corrosive or dirty atmosphere, periodically inspect and clean the wheel, inlet, and other moving parts to ensure smooth and safe operation.
- 4. Motors are normally permanently lubricated. Check bearings periodically. If they have grease fittings lubricate each season. Use caution when lubricating bearings. Wipe the fittings clean and lubricate the unit while rotating with your hand. Caution: Use care when touching the exterior of an operating motor. Components may be hot enough to burn or cause injury.
- 5. If bearings require lubrication, very little is needed. A general rule is one-half pump from a grease gun for 1/2" to 1-7/16" shaft diameters and one full pump for 1-11/16" and large diameter shafts for every 1500 to 3000 hours of operation. A lithium-based grease should be used. Bearings should be rotated as they are lubricated to evenly distribute the grease, either by hand or via extended grease lines. Do not attempt to grease bearings from inside the enclosure while the motor is energized. Caution:
 Bearings are sealed, over-greasing can cause damage to the bearings. Do not grease until grease comes out of seals. Only add the appropriate amount of grease.

2 Weeks After Start-up

- 1. Belt tension should be checked after the first 2 weeks of fan operation. See "Pulley Alignment/ Proper Belt Tension" on page 45.
- 2. All fasteners should be checked for tightness each time maintenance checks are performed before restarting unit.

Every 3 Months

- Belt tension should be checked quarterly. See "Pulley Alignment/Proper Belt Tension" on page 45.
 Over-tightening will cause excessive bearing wear and noise. Too little tension will cause slippage at start-up and uneven wear.
- 2. Filters need to be cleaned and/or replaced quarterly, and more often in severe conditions. Washable filters can be washed in warm soapy water. When re-installing filters, be sure to install with the **airflow** in the correct direction as indicated on the filter.

Yearly

- 1. Inspect bearings for wear and deterioration. Replace if necessary.
- 2. Inspect belt wear and replace torn or worn belts.
- 3. Inspect bolts and set screws for tightness. Tighten as necessary.
- 4. Inspect motor for cleanliness. Clean exterior surfaces only. Remove dust and grease and grease from the motor housing to ensure proper motor cooling. Remove dirt and grease from the wheel and housing to prevent imbalance and damage.

Start-up and Maintenance Documentation

START-UP AND MEASUREMENTS SHOULD BE PERFORMED AFTER THE SYSTEM HAS BEEN AIR BALANCED (Warranty will be void without completion of this form)
