"IPS PATCH" 3-WAY HYBRID PATCHBAYS AUDIO/VIDEO/DATA

This combination two rack unit panel is perfect for installations where a limited number of patch points are required. It offers a combination of audio, analog and/or digital video, and serial data patching. The space savings is ideal where real estate is at a premium. The innovative patchbay provides easy access and local area panel commonality for related signal paths.

Standard configurations are full-normaled and non-normaled. Other configurations are available.

Two rack unit video/stereo audio/data patchbay with 2 rows of 10 video, 10 stereo audio & 4 data pairs

SPECIAL PATCHBAYS

CUSTOM PATCHING SYSTEM CABLE ASSEMBLIES

Bittree specializes in custom cable assemblies for fast installs. This in-house capability grew out of customer demand for reliable pre-wired cable assemblies and harnesses.

Special RGB-S video patchbay shown with a single row of 20 grouped signal paths. The grouped RGB signals are patched with an RGB patchcord while the S signal is patched via a standard video patchcord

Model BRGBS20T Front View

Model APP96T Front View

MATING CONNECTORS

All Bittree Audio Patchbays include mating connectors, contacts and normals (where applicable). Mating hardware may be shipped in advance to expedite construction.

Important Notice:
All possible care has been taken in preparing this catalog. Statements and specifications are believed to be true but are not guaranteed and we are not responsible for any inaccuracies. Catalog data should not be used to establish specification limits, nor should catalog data be used alone as the basis for design.

Bittree reserves the right to change or alter specifications or materials without notice, provided the function and performance of the product remains reasonably the same or is improved.

video **Video Patching Systems**

SERIAL DIGITAL PATCHING

Bittree Video Patching Systems are excellent for use in the high bit rate serial digital domain, including formats such as D1, D2, D3, D5, HDTV and high resolution computer graphics. Typical applications for serial digital patching include monitoring, output routing from distribution amplifiers, VTRs, DDRs, VDRs, and signal processing equipment. The jacks provide excellent return loss characteristics and a high degree of isolation between signals.

ANALOG VIDEO PATCHING

Bittree Video Patching Systems are designed for exceptional performance in conventional analog video applications such as monitor routing, video distribution, rerouting, back up feeds and bypass functions. Bittree products have been designed and tested to meet rigid quality standards to ensure their long term dependability. Only the very best materials are specified; backed up by stringent assembly and test procedures. All components are selected from established industry standard sources.

COMPONENT ANALOG VIDEO PATCHING – RGB

RGB patchbays are designed to provide error-free signal routing between source and destination points. When working within the component analog video environment this patchbay ensures signal integrity.

VIDEO PATCHBAYS – FEATURES AND OPTIONS

- True 75 ohm impedance with low return loss
- Serial digital performance beyond 720 MHz
- Number of jacks may be specified as 24, 26 or 28 per row
- Front panel may be gray or black, 1 or 2 rack units
- RGB video patchbays with vertically or horizontally oriented RGB jack pattern
- 75 ohm WECO standard: .090 center pin diameter on all jacks
- Jacks may be ordered in any one of four configurations
 - Dual self-normaling non-terminated (2WN)
 - Dual self-normaling terminated (2WT)
 - Single self-terminating (1WT)
 - Single non-terminating (1WN)
- All jacks completely isolated from each other

TT Audio Patching Systems

TT (Bantam) Patching for
Analog & digital Audio Signals

CONVENTIONAL

ANALOG AUDIO PATCHING

Bittree Audio Patching Systems employ TT (Bantam) jacks to provide increased density where space is at a premium. The compact jack assemblies enhance studio versatility through instant and flexible rerouting of signals without taking up valuable rack or console real estate.

Typical applications include audio console I/O, audio routing switcher bypass and input rerouting, recording devices I/O, and master control and central switching I/O.

AES DIGITAL AUDIO PATCHING

AES (digital audio) patchbays are also available as standard products. The signal is faithfully carried over low-capacitance, shielded twisted-pair cable with a characteristic impedance of 110 ohms to accommodate the AES specification. Typically patchbays are full-normaled or non-normaled since it is necessary to provide a single 110 ohm load for each source. This feature also ensures prevention of impedance mismatches, improper loading, multiple connections or double termination (half-normaled not recommended). (See part number code for ordering information.)

TIME CODE PATCHING

For time code applications, the same electrical and mechanical concerns as for AES digital signals apply.

AUDIO PATCHBAYS - FEATURES AND OPTIONS

- Style may be chassis (single enclosure with attached rear panel) or harness type (detached rear panel—see page 1)
- Rear panel may be individual 3-pin connections or 90-pin interface
- Front panel may be gray or black, 1RU or 2RU
- Mating connectors, contacts and normals (where applicable) are included
- Customization available
- A wide range of options allow for patchbay design and configuration to meet individual requirements. Options include rear panel configurations, normals, grounds, stereo spacing, panel color and rack unit height

Serial Data Patching Systems

Bittree Serial Data Patching Systems are designed to meet the needs of RS422 Serial Data patching. Strictly held specifications guarantee exceptional performance in traditional serial data applications.

Typical applications for balanced data line RS422 serial data patching include machine control signal routing, feeds to audio/video recording and signal generating/processing equipment.

APPLICATIONS

- RS-422 serial data patching
- Edit system to VTR patching
- Remote control delegation (e.g., Sony and Lynx systems)
- Computer data interconnection
- Control panel re-routing
- Central distribution of 422 signals

SERIAL DATA PATCHBAYS – FEATURES AND OPTIONS

- Multiple “normaling” options
- All jacks are vertically paired with each pair normaled internally
- Rugged, reliable TT (Bantam) jacks on front panel
- Standard 9-pin D-Sub connectors on rear panel
- 12, 18, & 24 I/O paired ports available
- Single rack units available

Model DPP12T Two rack unit serial data patchbay with 12 paired ports
