To remove the work, stop the machine with the thread take-up lever at its highest point, raise the presser bar, hold the end of the seam firmly so as to prevent the threads from drawing the hemstitching together, then pull the work back about two inches and cut the threads close to the material.

Remove the hemstitching attachment from the machine, replace the regular presser foot and re-tighten the needle thread tension.

Fold the upper piece of cloth back on itself along the line of stitching, then fold the lower piece of cloth back on itself along the line of stitching, and gently pull the two pieces of cloth away from each other, thus bringing the hemstitching to view.

Then stitch down each side of the hemstitching in the ordinary manner, as shown in Fig. 5, placing the lines of stitching as close as possible to the line of hemstitching.

For hemstitching, the best results will be obtained by using fine thread. Nos. 60 or 70, or finer are recommended.
Remove the regular presser foot from the machine, and fasten the hemstitching attachment in its place as shown in Figs. 3 and 4, being careful to see that the needle passes through the centre of the needle hole in the attachment before firmly tightening the thumb screw.

Having secured two pieces of cloth, place one piece of cloth under the separator blade (A, Figs. 1 and 2) and back under the presser foot (B, Figs. 1 and 2) of the attachment. Then pass the other piece of cloth over the separator blade (A) and back under the presser foot (B) of the attachment. Slightly loosen the needle thread tension. Lower the presser bar and stitch the two pieces of cloth together, running the machine at a moderate speed.
