TECHNICAL DETAILS

ITAIR AIR PURIFIER

During the 1960s, NASA discovered that some plants eliminate harmful particles, not just from their leaves, but from their roots as well. Today, the IAVN researchers, along with the University of Florence, have developed an air purification system which, thanks to a controlled technological heart, converts polluting agents into nourishment for plants, which then project purified air into the surrounding environment through their roots. A plant equipped with this system, multiplies its performance up to a hundred times. ITAIR can be installed in all our environments, actively enhancing both one's well-being and creativity.

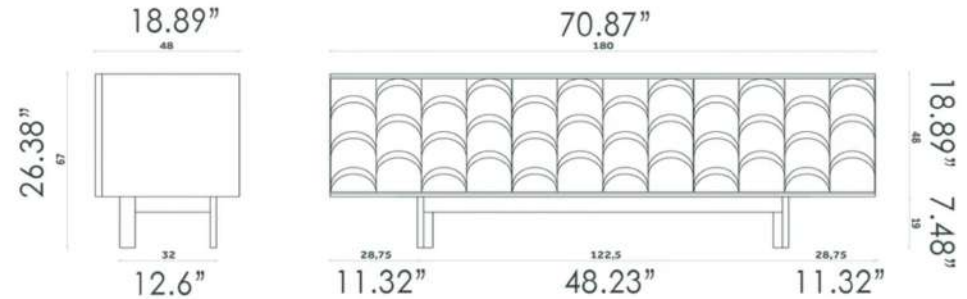

MATERIALS:

- Lacquer
- Metal
- Wood
