TECHNICAL DETAILS

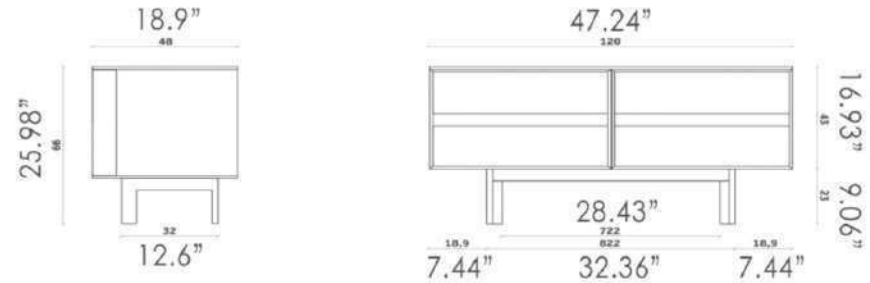

ITAIR AIR PURIFIER

During the 1980s, ANSA discovered that some plants absorb harmful air particles, not just from their leaves, but from their roots as well. Today, the UNIV-researchers, along with the University of Florence, have developed an air purification system which, thanks to a controllable technological heart, converts polluting agents into nourishment for plants, which then project purified air into the surrounding environment through their roots. A plant equipped with this system, multiplies its performance up to a hundred times. ITAIR can be installed in all our cupboards, actively influencing both one's well-being and creativity.

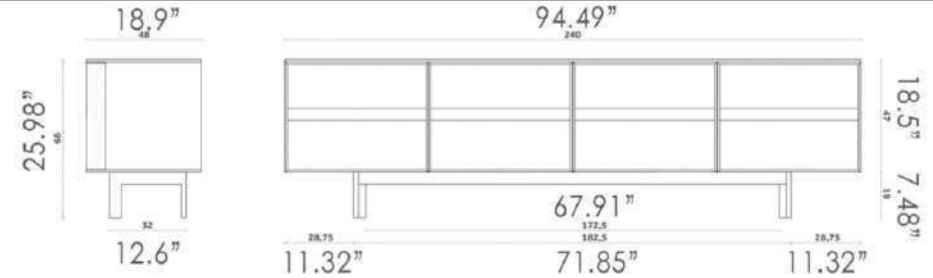

MATERIALS:
-Wood
-Lacquer
