

Important Information for users of Advancer® Shelves in Electric Kilns

Under certain circumstances Advancer® NSiC silicon carbide may act as an electrical conductor. Therefore, care should be taken to avoid direct element contact with shelves when using Advancer® shelves in electric kilns. For users of top loading, hobby and production kilns, it is important to place shelves so that they are centered properly within the kiln maintaining a gap between the shelf and the interior kiln wall and element grooves. Use only the appropriate size shelf for your specific kiln model. Advancer® shelves should not be used in kilns that are in poor repair with unpinned elements protruding out of their grooves. **In any case observe common sense rules and do not reach hands into an electric kiln unless it is turned off.** This will prevent the hazard of electric shock from any source within the kiln. Consult an application specialist for more detailed information.
