Spring 2006 Color Release

textures on neutral earthen hues, and introducing Cobblestones – a dimensional crackle glaze that can be used to create subtle or very pronounced crackle patterns. The glaze application, techniques and combinations you can use are endless – each ceramic project will be excitingly different.

INTRODUCING COBBLESTONES!

Cobblestone glazes produce a dimensional crackle finish. Crackle patterns achieved can be quite diverse, affected by product application methods and techniques. White Cobblestone can be tinted, providing you with even more decorating options.

Decorating with Cobblestones

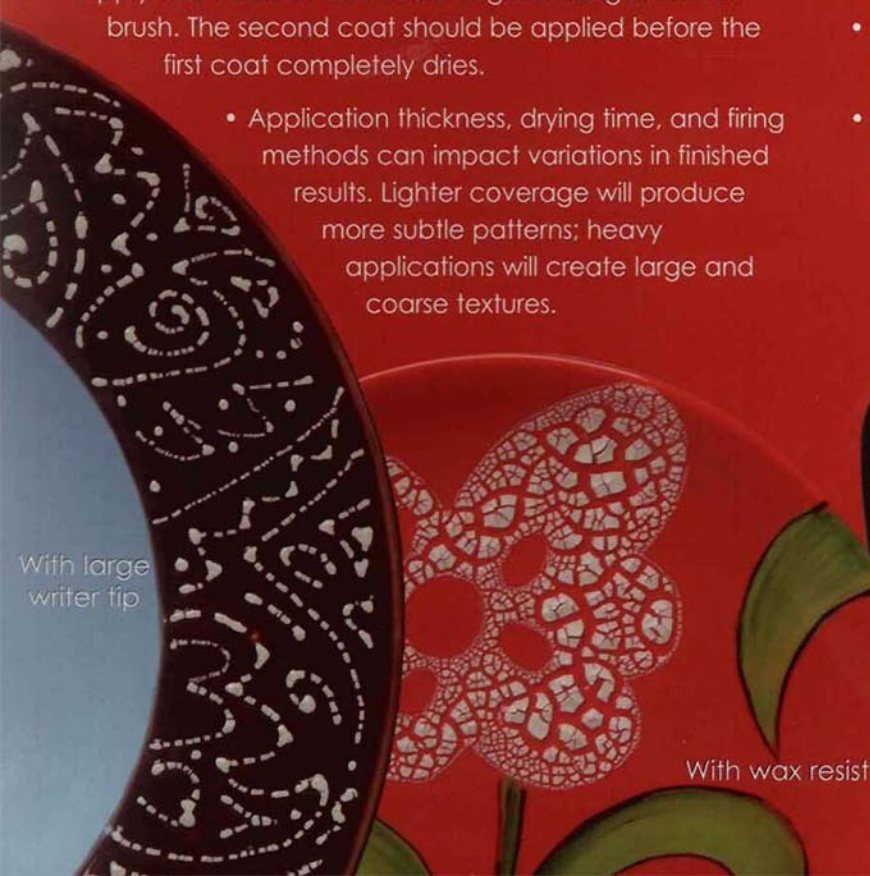

- Apply over non-toxic glazes. Allow glaze to dry.
- Apply two coats of Cobblestone glaze using a soft fan brush. The second coat should be applied before the first coat completely dries.
- Application thickness, drying time, and firing methods can impact variations in finished results. Lighter coverage will produce more subtle patterns; heavy applications will create large and coarse textures.
- Tint White Cobblestones with strong-pigmented Stroke & Coats® or One-Stroke.
- Rough handling of unfired Cobblestones can cause the glaze to flake off.
- Non-Toxic and Food Safe; however, Cobblestone's texture characteristics may make them unsuitable for food surfaces.

SG-202
White Cobblestone

Tips for Use

- Use sponges, detailer bottles and other tools to apply Cobblestones.
- Varying your brush strokes may influence the crackle pattern.
- Create unique designs using tape (for stripes) and wax resist for specific patterns.
