

GEAR MOD INSTALLATION

Remove the glass and lockbar, place a small towel on the playfield to protect it while working on your game. Use a phillips screwdriver and remove the inlane screws. Put the long screw through the gear mod hole then place the black spacer on the other side. Put these pieces back down and tighten screw down as indicated in the diagram. Do NOT overtighten. A snug fit will usually do it. If gears slip, just retighten when necessary.
