Hydraulic Roll-Off Automatic

Fitted on request on one or more sides of the top platform. It provides a safety retaining during forklift truck manoeuvring. It automatically raises when the table lifts beyond a “zero” level (for example ground level, loading dock level etc.) and it retracts when the table reaches or goes lower than the “zero” level.

When a forklift, pallet truck, a cart is moving onto the platform it's important to retain the equipment and avoid it to fall in case of excessive movement. It creates a safe zone and block the wheeled machine in case of movement towards the end of the platform.

Important! Consider 150 mm clearance between platform and lower frame necessary to fit every roll-off stop.
