Lower Frame on Wheels

It makes it possible to move the lift table quickly by hand. Thanks to the wheels below the table frame, the operator can easily move the lift tables from one location to another, depending of the usage need inside the plant.

The lift table has to be moved without the load. Once the lift table placed in the right position, it's enough to block the wheels with the specific brakes to secure the position and avoid any risk of movement, to preserve productivity and safety.

- n. 2 castor wheels with brake
- n. 2 fixed wheels (polyurethane)

Note: For type A1.10.E070/080 please consider max stroke 1550 mm.
