

PIKE AMPLIFICATION

The Vulcan is a new kind of overdrive. It packs two discrete overdrive signal paths in parallel, each with their own gain staging and tone shaping, into a compact enclosure. These signals are blendable via the color control, ensuring a vast range of tones from a simple control setup.

Built in Seattle, WA, USA

POWER

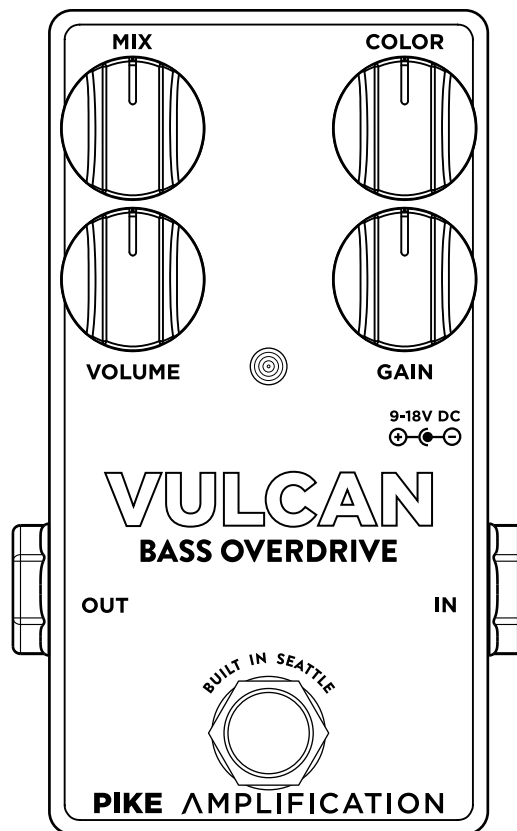

9v DC, 15mA minimum current draw. 2.1mm center-negative (Boss-style) plug. The Vulcan can be powered with up to 18v for a cleaner sound and increased headroom. Only use a regulated power supply.

MIX

Blends between the overdriven signal and the signal present at the pedal input. There is a fixed 6dB boost on the clean signal, so the clean signal is at unity gain when the mix control is centered.

VOLUME

The volume of the overdriven signal. The clean signal is not affected by the volume control.

COLOR

Blends between two parallel overdrive circuits. Fully counterclockwise is a clear, mid-focused sound that is reminiscent of a B-15. Fully clockwise is a modern, higher-gain sound with a mid scoop to accentuate the treble frequencies. Use the color knob in conjunction with your instrument's tone control for a wide variety of sounds.

GAIN

The gain of the overdriven signal, or how distorted the signal will sound.

BYPASS

Audiophile-grade buffered CMOS bypass switching system for silent, bulletproof switching through a clickless stomp switch.

WARRANTY

The Vulcan is engineered to last a lifetime, but sometimes things break. It is guaranteed against defects for one year. The warranty covers the pedal under normal use, not abuse. If you need to send your pedal in for repair, send an email to support@pikeamp.com
